1.0 INTRODUCTION

The Hoskins Landing Wetland Mitigation Site was developed to mitigate wetland impacts associated with Montana Department of Transportation (MDT) proposed Dixon-West and Paradise-East highway reconstruction projects along Montana Highway 200. This report documents the third year of monitoring at the site. Hoskins Landing is located in Sanders County in Watershed # 3 (Lower Clark Fork). The mitigation site is located approximately one-quarter mile north of Dixon, adjacent to the Flathead River (**Figure 1**). Elevation is approximately 2,500 feet with slight topographic variation throughout the project site. Western EcoTech conducted the original wetland delineation for the Hoskins Landing proposed mitigation site in 1999. Land & Water Consulting conducted a biological assessment for the Hoskins Landing Mitigation Project during fall 2001.

The approximate site boundary is illustrated on **Figure 2** (**Appendix A**), and the original site plans are included in **Appendix D**. The project is located adjacent to the Flathead River in an area of historic floodplain, heavily impacted from past agricultural activities. Seasonal flooding provides the primary wetland hydrology through inundation of backwater channels. Local groundwater systems moving though alluvium provide a secondary source of hydrology for this site. The site is located on the Flathead Indian Reservation and is managed by the Confederated Salish & Kootenai Tribes. The wetland easement area is mostly fenced with several exclusions on the east and west ends near the river banks. Livestock grazing has mostly been removed from the site with the establishment of electric fences, although a small corridor adjacent to the Flathead River is still accessible to livestock.

Most construction was completed in fall 2002 with the goal of restoring/creating 8.1 acres of wetlands and enhancing vegetation on 5.2 acres of heavily grazed and cleared lands. Construction diagrams are presented in **Appendix D**. Revegetation work was conducted during the spring and fall of 2003 and 2004. The primary components of construction include:

- Excavation and grading of 8.1 acres to facilitate wetland development.
- Enhancement of 5.2 acres of native vegetation characteristics in the lower Flathead River riparian corridor.
- Filling of inlet channel and removal of headgate in the northeast corner of the site.
- Removal of outlet dam along the remnant channel bordering the south portion of the site.
- Removal of man-made flood control berm along the Flathead River and grading of excavated ground to 10:1 slopes.
- Removal of a man-made berm along the remnant backwater channel.

The site was designed to mitigate for specific wetland functions impacted by MDT roadway projects, including: storm water retention, roadway runoff filtration, sediment and nutrient retention, water quality, groundwater recharge, wildlife habitat and riparian vegetation.

Pre-construction wetland delineation documented 6.67 acres of wetlands at the site (Western EcoTech, 1999). The monitoring area is illustrated on **Figure 2** (**Appendix A**).

2.0 METHODS

2.1 Monitoring Dates and Activities

Monitoring activities were conducted on July 21st, 2004. In 2002 and 2003, a spring –season (late May) visit was conducted to sample seasonal bird and other wildlife use. Attempts at a spring visit were "weathered out" in 2004; consequently, the July visit was the only one ultimately conducted in 2004. A spring visit will again be conducted in 2005. The mid-season visit was conducted to document vegetation, soil, and hydrologic conditions used to map jurisdictional wetlands. All information contained on the Wetland Mitigation Site Monitoring Form **(Appendix B)** was collected at this time. Activities and information conducted/collected included: wetland delineation; wetland/open water aquatic habitat boundary mapping; vegetation community mapping; vegetation transect; soils data; hydrology data; bird and general wildlife use; photograph points; macroinvertebrate sampling; GPS data points; functional assessment; and (non-engineering) examination of topographic features.

2.2 Hydrology

Wetland hydrology indicators were recorded during the mid-season visit using procedures outlined in the COE 1987 Wetland Delineation Manual (Environmental Laboratory 1987). Hydrology data were recorded on COE Routine Wetland Delineation Data Forms (**Appendix B**). Additional hydrologic data were recorded on the mitigation site monitoring form (**Appendix B**). No groundwater monitoring wells were installed at the site

2.3 Vegetation

General dominant species-based vegetation community types (e.g., *Eleocharis/Phalaris*) were delineated on an aerial photograph during the mid-season visit. Standardized community mapping was not employed as many of these systems are geared towards climax vegetation and do not reflect yearly changes. Estimated percent cover of the dominant species in each community type was listed on the site monitoring form (**Appendix B**).

A 10-foot wide belt transect was established during the mid-season monitoring event to represent the range of current vegetation conditions. Percent cover was estimated for each vegetative species within each successive vegetative community encountered within the "belt" using the following values: T (few plants); P (1-5%), 1 (5-15%); 2 (15-25%); 3 (25-35%); 4 (35-45%); 5 (45-55%) and so on to 9 (85-95%). Wetland indicator status was recorded for each species. The transect location is illustrated on **Figure 2** (**Appendix A**). The transect will be used to evaluate changes over time, especially the establishment and increase of hydrophytic vegetation. The transect location was marked on the aerial photo and all data were recorded on the mitigation site monitoring form. Transect endpoint locations were recorded with the GPS unit in 2002. A photo was taken from both ends of the transect along the transect path.

A comprehensive plant species list for the site was compiled and will be updated as new species are encountered. Ultimately, observations from past years will be compared with new data to document vegetation changes over time.

2.4 Soils

Soils were evaluated during the mid-season site visit using the hydric soils determination procedures outlined in the COE 1987 Wetland Delineation Manual. Soil data were recorded for each wetland determination point on the COE Routine Wetland Delineation Data Forms (**Appendix B**). The most current terminology used by NRCS was used to describe hydric soils (USDA 1998).

2.5 Wetland Delineation

Wetland delineation was conducted during the mid-season visit according to the 1987 COE Wetland Delineation Manual. Wetland and upland areas within the monitoring area were investigated for the presence of wetland hydrology, hydrophytic vegetation and hydric soils. The information was recorded on COE Routine Wetland Delineation Data Forms (**Appendix B**). The wetland/upland boundary was originally delineated on the aerial photo and then recorded with a resource grade GPS unit using the procedures outlined in **Appendix E**. Modifications to these boundaries in 2004 were accomplished by hand mapping onto the 2002 aerial photograph. The wetland/upland boundary in combination with the wetland/open water boundary was used to calculate the final wetland acreage. Pre-construction wetland delineation documented 6.7 acres of wetlands at the site (Western EcoTech 1999).

2.6 Mammals, Reptiles and Amphibians

Mammal and herptile species observations and other positive indicators of use, such as vocalizations, were recorded on the wetland monitoring form during each visit. Indirect use indicators, including tracks, scat, burrows, eggshells, skins, bones, etc. were also recorded. Observations were recorded as the observer traversed the site while conducting other required activities. Direct sampling methods, such as snap traps, live traps, and pitfall traps, were not used.

2.7 Birds

Bird observations were recorded during the mid-season visit during 2004. No formal census plots, spot mapping, point counts, or strip transects were conducted. Observations were recorded incidental to other monitoring activities and were categorized by species, activity code, and general habitat association. A spring wildlife assessment visit will be again implemented in 2005.

2.8 Macroinvertebrates

Macroinvertebrate samples were collected during the mid-season site visit at two separate locations (**Figure 2**). Samples were preserved as outlined in the sampling procedure **(Appendix F)** and sent to Rhithron Associates for analysis.

2.9 Functional Assessment

A functional assessment form was completed using the 1999 MDT Montana Wetland Assessment Method (**Appendix B**). Field data necessary for this assessment were collected during the mid-season visit. Western Eco Tech completed baseline functional assessment during the initial wetland delineation using the 1996 MDT Montana Wetland Field Evaluation Form.

2.10 Photographs

Photographs were taken illustrating current land uses surrounding the site, the upland buffer, the monitored area and the vegetation transect. Each photograph point location was recorded with a resource grade GPS in 2002. The location of photo points is shown on **Figure 2**, **Appendix A**. All photographs were taken using a digital camera.

2.11 GPS Data

During the 2002 monitoring season, point data were collected with a resource grade GPS unit at the vegetation transect beginning and ending locations and at all photograph locations. Wetland boundaries were also recorded with a resource grade GPS unit in 2002, but were modified via hand mapping onto aerial photographs in 2004. The method used to collect these points is described in the GPS protocol in **Appendix E**.

2.12 Maintenance Needs

Observations were made of existing structures and of erosion/sediment problems to identify maintenance needs. This did not constitute an engineering-level structural inspection, but rather a cursory examination. Current or future potential problems were documented on the monitoring form.

3.0 RESULTS

3.1 Hydrology

The main source of hydrology is seasonal flooding by the Flathead River. This mitigation site occurs in Flathead River floodplain consisting of back channels and open water areas. The eastern end of the site once contained a headgate that controlled the flow of water into the remnant channel running along the southern boundary. This has been removed, allowing water to flow through channel during seasonally high flows. A secondary source of hydrology is the persistent upwelling and lateral movement of groundwater through the alluvium materials. The water regime at Hoskins Landing is ultimately controlled by water release from Kerr Dam over 42 miles upriver.

Open water occurred across approximately 1.14 acres or 9% of the wetland area (**Figure 3**) during the mid-season visit. Water depth at the open water/rooted vegetation boundary was approximately 0.5 feet. Inundation was observed at this time across another 60% of the wetland area. Inundation was present throughout all of community types 1, 2, 3, 11 and 12 (**Figure 3**).

3.2 Vegetation

Eighty-two plant species were identified at the site and are listed in **Table 1**. The majority of these species are herbaceous. A few small remnant shrub patches exist, found mostly along the active backwater channel. Several small stands of black cottonwood (*Populus trichocarpa*) and box elder (*Acer negundo*) occur on higher terraces located along the river and backwater channels. Seven wetlands types and six upland community types were identified and mapped at the mitigation site (**Figure 3**, **Appendix A**). The seven wetland community types include Type 2: *Eleocharis/Phalaris,* Type 3: *Potamogeton/Elodea,* Type 5: *Phalaris/Salix,* Type 7: *Phalaris,* Type 11: *Ceratophyllum,* Type 12: *Juncus/Eleocharis* and Type 13: *Phalaris/Agrostis.* Plant species observed within each of these communities are listed on the attached data form (**Appendix B**). The six upland community types include Type 4: *Agropyron/Melilotus,* Type 6: *Festuca/Phleum,* Type 8: *Agropyron/Plantago,* Type 9: *Bromus,* Type 10: *Populus/Crataegus,* and Type 14: *Agrostis/Poa.* Plant species observed within each of these communities are listed on the attached data form (**Appendix B**).

Types 3 and 11 are the wettest community types and occurred as aquatic bed/emergent wetland communities in the shallow waters of the excavated wetlands and remnant backwater channel (**Figure 3**). Type 3 is dominated by largeleaf pondweed (*Potamogeton amplifolius*), curly pondweed (*Potamogeton crispus*), broad water-weed (*Elodea canadensis*) and least spike-rush (*Eleocharis acicularis*). Type 11 is mostly dominated by common hornwort (*Ceratophyllum demersum*). Type 2 and 12 are the next wettest areas, consisting of emergent vegetation types occurring in an undisturbed wetland and the fringes of excavated wetland.

Type 2 is located on the west side, surrounded by the newly constructed wetlands, dominated by least spike rush, reed canarygrass (*Phalaris arundinacea*) and bulrush (*Scirpus acutus*). Type 12 occurs along the fringes of excavated wetland in areas that receive annual inundation; vegetation is dominated by three-stamen rush (*Juncus ensifolius*), creeping spike rush (*Eleocharis palustris*) and redtop (*Agrostis alba*). Type 5 occurs throughout the backwater channel located on the south side of the project border. Type 7 and 13 are the least wet, dominated by reed canarygrass, located within the seasonally flooded areas adjacent to river. A few mature cottonwoods growing on the along the river terrace are also mapped as part of the Type 7 community.

Adjacent upland vegetation communities are mainly dominated by rangeland and/or aggressive invasive species. Type 6 upland areas are currently dominated with pasture grasses such as *Festuca/Phleum.* Type 4 upland areas increased in vegetation cover, now mostly dominated by upland grass species including quackgrass (*Agropyron repens)* and slender wheatgrass (*Elymus trachycaulus).* Native shrubs were planted during the spring of 2003 and 2004, as part of the riparian enhancement efforts. The cover value of the plantings has increasing since the previous monitoring, but currently is not considered dominant for this community type.

Type 10 is located along the higher terraces of the river and backwater channel, consisting of mature cottonwoods and box elder. A minor shrub layer is present, consisting of hawthorne (*Crataegus douglasii*) and American plum (*Prunus americana*). Type 8 is located adjacent to the Flathead River and along the backwater channels. Type 8 is dominated by quackgrass, redtop and English plantain (*Plantago lanceolata*). Type 14 is located near the back water channel along the southern boundary of the mitigation site and is a new vegetation community.

Type 14 is dominated by redtop and Kentucky bluegrass (*Poa pratensis*). This area was considered within the Type 6 community during previous monitoring. The removal of livestock from this area has allowed the dominant species to flourish.

Several noxious weeds were observed throughout the Hoskins Landing site. Type 4 and 6 had small amounts of invasive species. During the 2003 mapping Type 9 was dominated by mostly invasive species. Evidence of weed control measures were observed during the 2004 monitoring. These control measures have reduced the cover of invasive species and increased the cover value of grasses within Type 9. Type 9 is currently dominated by non-native grass species that usually follow a disturbance such as herbicide application.

Category 1 Noxious weeds found at this mitigation site include: spotted knapweed (*Centaurea maculosa*), Canada thistle, hounds tongue (*Cynoglossum officinale*), oxeye daisy (*Chrysanthemum leucanthemum*), St. John's wort (*Hypericum perforatum*) and Dalmatian toadflax (*Linaria dalmatica*). One Category 3 noxious weed was also found: yellowflag iris (*Iris pseudacorus*). Other exotic weedy species include curly dock (*Rumex crispus*), common dandelion (*Taraxicum officinalis*), white goosefoot, pepper-grass (*Lepidium perfoliatum*), tumbleweed (*Sisymbrium altissimum*) and quackgrass.

Vegetation transect results are detailed in the attached data forms (**Appendix B**) and are summarized in **Table 2** and **Charts 1** and **2.**

Table 1: ***2002, 2003, and 2004 Hoskins Landing vegetation species list.***

Scientific Name[1]	Common Name	Region 9 (Northwest) Wetland Indicator
Acer negundo	box elder	FAC+
Agropyron repens	quackgrass	FACU
Agrostis alba	redtop	FAC+
Achillea millefolium	common yarrow	FACU
Alnus incana	alder	FACW
Alopecurus pratensis	meadow foxtail	FACW
Amaranthus retroflexus	red-root pigweed	FACU+
Amelanchier alnifolia	serviceberry	FACU
Artemisia ludoviciana	white sagebrush	FACU-
Bromus japonicus	Japanese brome	UPL
Bromus tectorum	cheatgrass	--
Carex bebbiana	Bebbs sedge	OBL
Carex lanuginose	wooly sedge	OBL
Carex nebrascensis	Nebraska sedge	OBL
Carex retrorsa	retrorsa sedge	FAC
Carex utriculata	beaked sedge	OBL
Centaurea maculosa	spotted knapweed	--
Ceratophyllum demersum	common hornwort	OBL
Chenopodium album	white goosefoot	FAC
Chrysanthemum leucanthemum	oxeye daisy	--
Cirsium arvense	Canada thistle	FACU+
Cirsium vulgare	bull thistle	FACU
Coreopsis atkinsoniana	tickseed	FACU
Cornus stolonifera	red-osier dogwood	FACW
Crataegus douglasii	Douglas hawthorn	FAC

Chart 1: ***Transect maps showing vegetation type from the start of transect (0 feet) to the end of transect (390 feet).***

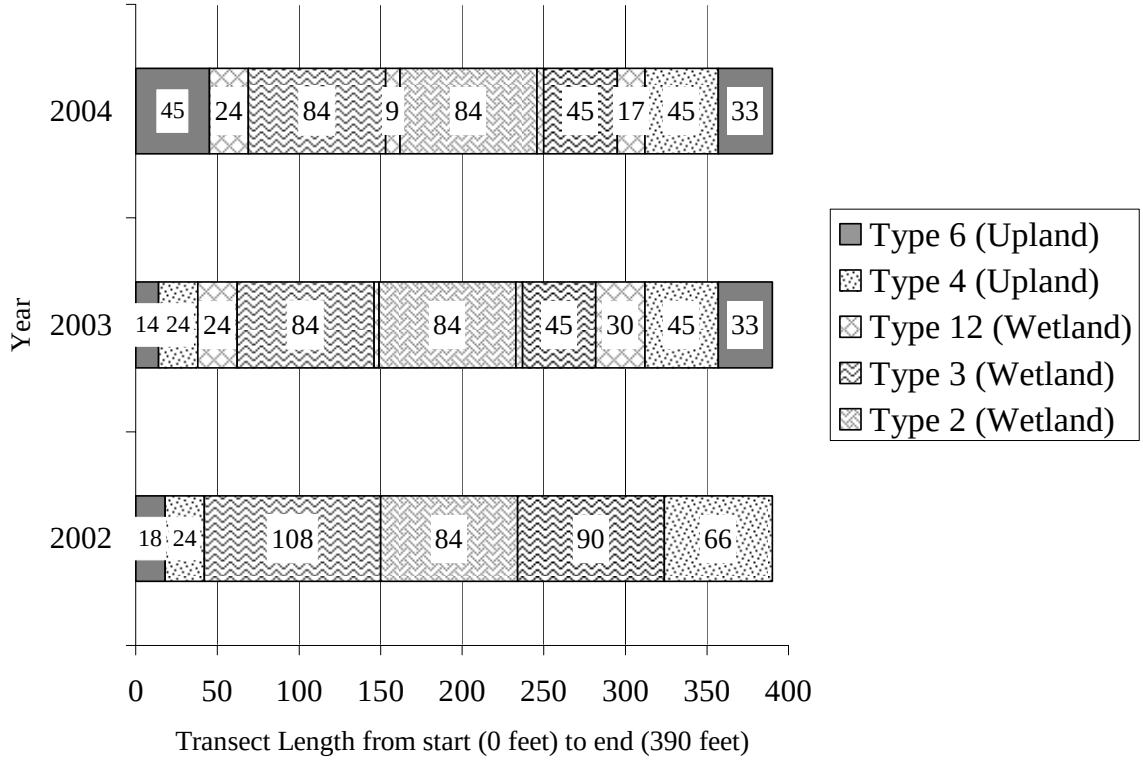

Chart 2: ***Length of vegetation communities along Transect 1.***

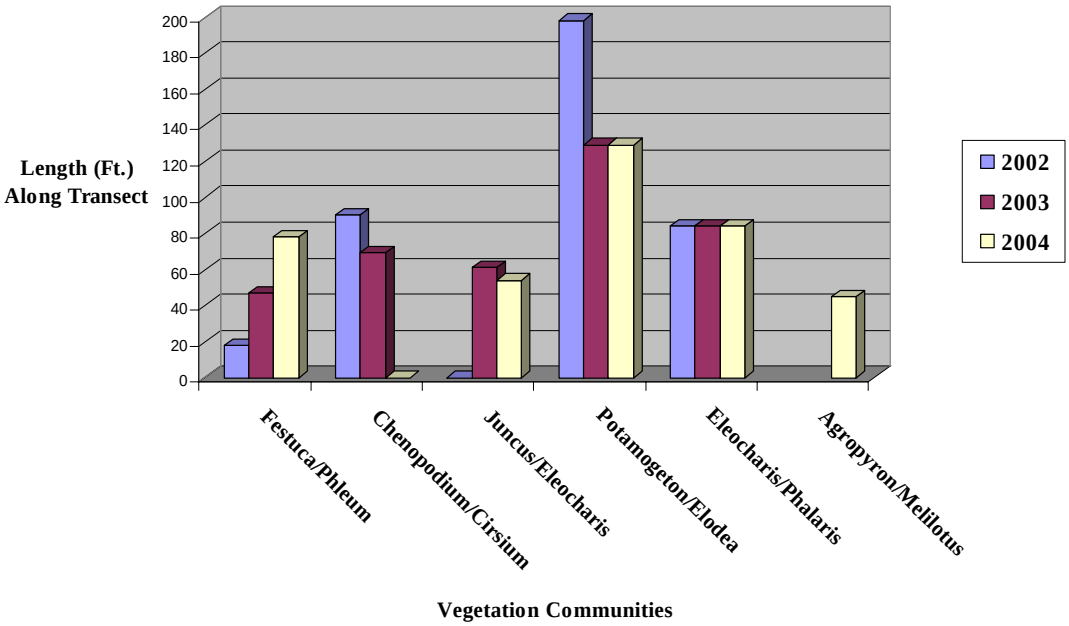


3.3 Soils

Soils at the site are mapped in the Sanders County Soil Survey as Horseplains-riverwash and Revais silt loam. Horseplains-riverwash is described as a fine sandy loam, 60 inches deep with a lighter surface layer, and slopes of 0-2%. Revais silt loam has a depth of 60 inches with lighter colored surface and slopes of 0-2% (NRCS 2002). Horseplains and Revais soils are not listed on the Montana NRCS Hydric Soil list. Soil characteristics at each wetland determination point were compared with those of the Horseplains and Revais soil. The soils observed across most of the site did not generally match the Horseplains and Revais soil descriptions, as textures were slightly different.

Wetland soils observed during monitoring and documented on the Routine Wetland Determination form were mostly loams, silt loams or clays with very low chromas (1 or 2) within 2 inches of the surface. Mottles (redoximorphic features) were present in three profiles, both having surface inundation. The two remaining soil profiles described on the Routine Wetland Determination forms were mapped as upland sampling points, having no soil moisture or distinct hydric characteristics within 18 inches of the surface.

3.4 Wetland Delineation

Delineated wetland boundaries are illustrated on **Figure 3** in **Appendix A**. Completed wetland delineation forms are included in **Appendix B**. Soils, vegetation, and hydrology are discussed in preceding sections. Wetland conditions were identified during the 2004 monitoring (**Table 3**).

Table 3: ***Wetland conditions identified during monitoring from 2002 to 2004.***

Condition	Monitoring Area 2004	Monitoring Area 2003	Monitoring Area 2002
Gross Aquatic Area	13.02	12.49	12.13
Open Water Area	1.14	1.14	1.14
Net Wetland Area	**11.88**	**11.35**	**10.99**

Approximately 11.88 wetland acres and 1.14 open water acres are currently within the monitoring area (**Table 3**, **Figure 3**). The pre-construction wetland delineation reported 6.67 wetland and no open water acres. A pre-project delineation map is provided in **Appendix D**. The net increase in aquatic habitat acres is 13.02 – 6.67 = 6.35 acres. Additional area may form with time and more normal precipitation around the low gradient portions of the current wetland area.

An increase of 0.53 wetland acre was observed between 2003 and 2004 monitoring. The increase in wetland acres was recorded along the shoreline of the excavated wetland and a section of the backwater channel located nearest to the Flathead River. Community Type 12 is mapped as developing emergent vegetation in areas inundated by seasonal flooding. Community Type 13 is a wetland area located adjacent to the shoreline of the excavated wetlands, further up the bank in less saturated conditions.

During 2003 and 2004 delineations, the backwater channel areas were mapped as waters of the U.S. due to the hydrologic connection to the Flathead River. Some of these areas are also mapped as wetlands, but most of this area is not considered wetland due to the lack of qualifying vegetation and soil characteristics. During the 2002 monitoring, vegetative cover was dominated by mostly invasive upland species. The majority of the backwater channel remains in a similar condition to that observed during 2002 and 2003 monitoring.

The only decrease in wetland area was observed within Community Type 7 located in the eastern side of the project, bordering the river. This area was delineated as a larger unit during 2002 monitoring. Located at a slightly higher elevation than the adjacent backwater channel, these areas were not subject to the intense scouring effects observed within other wetland areas located along the backwater channels. During the 2003 and 2004 monitoring, this area was observed to have a portion dominated by mostly upland species associated with Community Type 6 and was classified as upland.

3.5 Wildlife

Wildlife species or evidence of wildlife, observed on the site during 2002, 2003, and 2004 monitoring efforts is listed in **Table 4**. Specific evidence observed, as well as activity codes pertaining to birds, are provided on the completed monitoring form in **Appendix B**.

This site provides habitat for a variety of wildlife species. One mammal and three bird species were noted at the mitigation site during the 2004 site visits. Many other wildlife species presumably use the site but were not observed during the monitoring visit.

Table 4: ***Wildlife species observed at the Hoskins Landing Mitigation Site during 2002, 2003, and 2004 monitoring.***

FISH None (no fish surveys implemented)	
AMPHIBIANS None	
REPTILES Painted Turtle (*Chrysemys picta*)[3]	
BIRDS American Crow (*Corvus brachyrhynchos*) Barn Swallow (*Hirundo rustica*)[1] **Black & White Warbler (*Mniotilta varia*)** Blue-winged Teal (*Anas discors*)[1] Canada Goose (*Branta canadensis*)[1] Cinnamon Teal (*Anas cyanoptera*)[1] Eurasian Wigeon (*Anas Penelope*)[1] **Field Sparrow (*Spizella pusilla*)** Great Blue Heron (*Ardea herodias*) Killdeer (*Charadrius vociferous*) Lesser Yellowlegs (*Tringa flavipes*)[1] Mallard (*Anas platyrhynchos*) Mallard (*Anas platyrhynchos*)[1] Northern Shoveler (*Anas clypeata*)[1] Osprey (*Pandoin haliaetus*)	Red-tail Hawk (*Buteo jamaicensis*) **Red-winged blackbird (*Agelaius phoeniceus*)** Song sparrow (*Melospiza melodia*) Spotted sandpiper (*Actitis macularia*) Tree Swallow (*Tachycineta bicolor*)[1] Wood Duck (*Aix sponsa*)[1] Yellow-headed blackbird (*Xanthocephalus xanthocephalus*)
MAMMALS Coyote (*Canis latrans*) **Deer (*Odocoileus spp.*)**	Mouse [young] (*Peromyscus* spp.)[1] Muskrat (*Ondatra zibethicus*)[2]

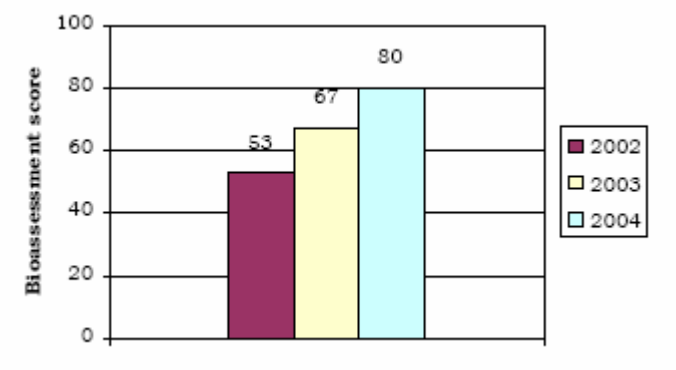
Bolded species were observed during 2004 monitoring. All other species were observed during one or more of the previous monitoring years, but not during 2004.
[1] Observed by MDT during spring and/or fall of 2004.
[2] Observed in side channel by MDT during 2004.
[3] Observed within old channel on southern boundary by MDT during spring of 2004.

3.6 Macroinvertebrates

Complete results from the macro invertebrate sampling locations (**Figure 2**) are presented in **Appendix F.** Sampling points for Hoskins Landing were located along the western side of the excavated wetland. The following analysis was provided by Rhithron Associates (Bollman 2004).

*Poor conditions reported in 2002 apparently improved to sub-optimal conditions at the Hoskins Landing site in 2003 and further improved to optimal conditions in 2004, according to bioassessment scores (**Chart 3**). Benthic assemblage sensitivity may have increased since 2003; more sensitive taxa appeared in 2004 compared to earlier years. The biotic index value, however, remained stable at values well below the median for all sites studied in all years. This suggests that water quality was very good here. Habitats apparently remained limited to macrophyte surfaces and the water column; there were few midges or other benthic denizens.*

Chart 3: ***Bioassessment scores for Hoskins Landing.***



3.7 Functional Assessment

Completed 2004 functional assessment forms are included in **Appendix B**. The Hoskins Landing site was separated into two assessment areas (AAs) for the purpose of functional assessments. The two assessment areas on the Hoskins Landing mitigation site are currently rated as Category III (moderate value), primarily due to moderate ratings for wildlife/fish habitat, TE species habitat, and flood attenuation variables. Other factors contributing to this score were low rating for MNHP species habitat, sediment/nutrient removal, sediment/shoreline stabilization and recreation/education ratings.

The main body of the site received a high rating for surface water storage due to the acre-feet of water contained in wetlands. The variable for production export/food chain support rated high due to the overall vegetated acres, high structural diversity and perennial water regime. The site received a moderate fish rating due to surface water duration and some habitat deficiencies. The site received a moderate flood attenuation rating due to the presence of an inflow channel into the wetland and restricted nature of outlet. The site received a low recreation/education rating since it has moderate disturbance level and is in private (Tribal) ownership. The site received a low rating for sediment/shoreline stability due to a lack of plants with deep binding roots. Recent revegetation efforts along the fringe of excavated wetland should overtime eventually increase the sediment/shoreline stability rating.

Based on functional assessment results (**Table 5)**, approximately 89.9 functional units occur at the Hoskins Landing mitigation site. Baseline functional assessment results are also provided in **Table 5** for general comparative purposes. However, it should be noted that direct comparison between the baseline and 2004 functional assessments are not possible as they were completed using different versions of the MDT functional assessment method. The baseline assessment was completed using the 1996 version, while the 2002, 2003 and 2004 assessments were conducted using the most current (1999) version.

Table 5: ***Summary of baseline, 2002, 2003and 2004 wetland function/value ratings and functional points [1] at the Hoskins Landing Mitigation Project.***

Function and Value Parameters From the 1999 MDT Montana Wetland Assessment Method	WETLAND NUMBERS ASSESSED WITH 1996 METHOD						WETLANDS ASSESSED WITH 1999 METHOD					
	Baseline 1A	Baseline 1B	Baseline 3	Baseline 8	Baseline 2, 9A, 9B, 10, 11, 12, 13	Baseline 5, 6, 7, 14A, 14B	2002 Site 5	2002 Remainder of Wetlands	2003 Site 5	2003 Remainder of Wetlands	2004 Site 5	2004 Remainder of Wetlands

Net Functional Unit Gain (fu)	**NA**						**48.91**		**51.33**		**58.7**	

[1] See completed 2004 MDT functional assessment forms **Appendix B** for further detail.

[2] The baseline assessment was performed using the 1996 MDT assessment method, of which several parameters were substantially revised and applied to the 1999 MDT assessment method. The 1999 MDT assessment method was used in 2002 to 2004. Therefore, direct comparison of pre- and post-project functions are not possible, but some general trends can be noted.

[3] Did not achieve Category II rating based on functional points, but did achieve Category II rating based on score for fish and wildlife habitat. This narrow fringe wetland was absent during the 2004 delineation.

3.8 Photographs

Representative photographs taken from photo-points and transect ends are presented in **Appendix C**. A copy of the 2004 aerial photograph is also provided in **Appendix C**.

3.9 Revegetation Efforts

Wetland and riparian vegetation enhancements were implemented in the 2003 and 2004. **Appendix G** presents the different planting specification for each seed mix and containerized plantings. These enhancements included drill seeding of an upland seed mix into the areas of higher topography and planting of native tree, shrub, grass and grass-like seedlings. Plants installed in the upland areas included two tree species, cottonwood and ponderosa pine *(Pinus ponderosa),* and seven shrub species including American plum, chokecherry *(Prunus virginiana),* hawthorn (*Crataegus douglasii*) serviceberry *(Amelanchier alnifolia),* snowberry (*Symphoricarpos albus),* Rocky Mountain juniper *(Juniperus scopulorum), and* woods rose (*Rosa woodsii).*

Wetland areas surrounding the excavated open water area were broadcast seeded with a custom wetland seed mix and also planted with seedlings. Vegetation planted in the wetland areas included three tree species - cottonwood, quaking aspen *(Populus tremuloides)*, and water birch (*Betula occidentalis*), and four shrub species - alder (*Alnus incana),* red osier dogwood *(Cornus stolonifera),* Bebbs willow (*Salix bebbiana*) and sandbar willow *(Salix exigua)*. Five herbaceous wetland species were planted along the fringe of the excavated wetland. These species included hardstem bulrush (*Scirpus microcarpus*), Nebraska sedge (*Carex nebrascensis*), beaked sedge (*Carex utriculata*), Bebbs sedge (*Carex bebbiana*), and small-fruited bulrush (*Scirpus microcarpus*).

Survival rates for native shrub plantings were assessed during the summer of 2003 and 2004. Both Land & Water Consulting (**LWC**) and Salish Kootenai College (**SKC**) conducted separate survival ratings for 2003 and 2004 plantings. LWC results are presented in **Appendix B** in the *Wetland Mitigation Site Monitoring Form.* The survival data presented in the body of the report are based on SKC more intensive monitoring during 2004. **Appendix G** presents detailed survival information for each species and planting area.

Two upland plantings areas were evaluated; these areas include the upland islands and side channel. Survival rates for the upland areas ranged from 90% to 100 % for shrub species. No survival data was collected for tree species planted in fall 2003. All planted shrub species are exhibiting a high survival rate.

Two wetland-planting areas were also evaluated; these sites included the excavated wetland and inlet channel. Survival rates for the wetland areas ranged from 91% to 100% for the tree species and 29% to 81% for the shrub species. Cottonwood and red osier dogwood had some of the highest survival rates. Several species that had low survival rates during the 2003 monitoring were replanted in 2004. The replacement plants are doing well and exhibited a high survival rate in 2004. The excavated wetland was also re-sprigged with two species of willows. Approximately 2000 willow cuttings were installed around the fringe of excavated wetland.

The low survival rates observed during 2003 monitoring have been increased due to consistent irrigation of plantings. The irrigation system was non-functional in 2003, but was repaired and used during the 2004 season.

3.10 Maintenance Needs/Recommendations

Several Category 1 noxious weeds were still present: Canada thistle, hound's-tongue, and dalmatian toadflax. The Category 3 yellowflag iris was also present within the mitigation site. These species must be controlled under the Montana County Noxious Weed Control Act [7-22-2151]. Weed control activities were observed during the early and mid-season visits. The continued eradication of noxious weeds at this site is important. The majority of the invasive species were still found at this site within the dry backwater channels adjacent to the river.

3.11 Current Credit Summary

At this time approximately 11.88 acres of wetland and 1.14 acres of open water occur on the mitigation site. Subtracting the original 6.67 acres of pre-project wetlands from this total yields a current net of approximately 6.35 wetland/open water acres. It is likely that additional acreage will form with additional time and more normal precipitation. Additionally, approximately 58.7 functional units have been gained at the site, although pre- and post-construction functional assessment methods slightly differed.

LAND & WATER

MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: Hoskins Landing Project Number: 330054.110 Assessment Date: 07 / 21 / 04
Location: N. of Dixon, MT MDT District: Missoula Milepost:
Legal description: T: 18 R: 21 Section: 18 Time of Day: Afternoon to early evening
Weather Conditions: Overcast Person(s) conducting the assessment: Greg Howard
Initial Evaluation Date: 09 / 04 / 02 Visit #: 3 Monitoring Year: 2004
Size of evaluation area: 48 acres Land use surrounding wetland: Agriculture; alfalfa & cattle grazing

HYDROLOGY

Surface Water Source: Flathead River
Inundation**:** Present X Absent Average depths: 1.5 ft Range of depths: 0 – 2 ft
Assessment area under inundation: 40 %
Depth at emergent vegetation-open water boundary: 0.5 ft
If assessment area is not inundated are the soils saturated w/in 12" of surface**:** Yes - No -
Other evidence of hydrology on site (drift lines, erosion, stained vegetation etc.): Drift lines present around excavated wetland. Site experiences seasonal high water event; inundation of excavated wetland by flooding of backwater channel.

Groundwater
Monitoring wells: Present Absent x
Record depth of water below ground surface

Well #	Depth	Well #	Depth	Well #	Depth

Additional Activities Checklist:
X Map emergent vegetation-open water boundary on air photo
X Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining etc.)
- GPS survey groundwater monitoring wells locations if present

COMMENTS/PROBLEMS: No major changes observed at the site during 2004 monitoring. Vegetation cover has increase throughout the entire site. These included the seeded upland areas, emergent vegetation around the excavate wetland fringe and the backwater channels areas heavily scoured during 2002 high water event. Several new planting areas were observed and weed control measure were conducted around the existing plantings areas and throughout the site.

VEGETATION COMMUNITIES

Community No.: _2__ Community Title (main species): Eleocharis / Phalaris

Dominant Species	% Cover	Dominant Species	% Cover
Scirpus acutus	10	*Sagittaria latifolia*	20
Scirpus validus	P	*Carex retrorsa*	P
Phalaris arundinacea	30		
Eleocharis palustris	50		
Potamogeton natans	10		

COMMENTS/PROBLEMS: Undisturbed emergent wetlands located on W. side of site. Type 2 is connected to the outlet of the southern backwater channel. Area is surrounded by excavated wetlands. Wetland inundated during mid-season visit.

Community No.: _3__ Community Title (main species): Potamogeton / Elodea

Dominant Species	% Cover	Dominant Species	% Cover
Potamogeton amplifolius	60		
Elodea canadensis	10		
Potamogeton crispus	10		
Potamogeton natans	T		

COMMENTS/PROBLEMS: Areas of aquatic vegetation located within the excavated wetlands.

Community No.: _4__ Community Title (main species): Agropyron / Melilotus

Dominant Species	% Cover	Dominant Species	% Cover
Plantago lanceolata	T	*Helianthus annuus*	P
Plantago major	P	*Lepidium perfoliatum*	P
Cirsium arvense	P	*Chrysanthemum leucanthemum*	T
Verbascum thapsus	T	*Centaurea maculosa*	T
Agropyron repens	40	Plantings	10
Achillea millefolium	10	*Coreopsis atkinsoniana*	P
Elymus trachycaulus	20		

COMMENTS/PROBLEMS: Constructed upland slopes w/ re-contoured topography and native shrub plantings. Area mostly dominated by *Agropyron repens* and other invasive or disturbance related species. One Montana State listed noxious weeds, *Cirsium arvense*.

Additional Activities Checklist:
_X_ Record and map vegetative communities on air photo

COMMENTS: Community # 1 is open water.

VEGETATION COMMUNITIES

Community No.: _5__ Community Title (main species): Phalaris / Salix

Dominant Species	% Cover	Dominant Species	% Cover
Phalaris arundinacea	60	*Juncus ensifolius*	T
Salix exigua	30	*Eleocharis acicularis*	P
Juncus balticus	P	*Salix bebbiana*	T
Scirpus acutus	T		
Cornus stolonifera	T		

COMMENTS/PROBLEMS: Undisturbed side channel running along S. edge of project boundary. Channel w/ stagnate water, no flowing inlet or outlet, except during seasonally high flows. Channel vegetation consisting mostly of aquatic bed, emergent and scrub-shrub types.

Community No.: _6__ Community Title (main species): Festuca / Phleum

Dominant Species	% Cover	Dominant Species	% Cover
Phleum pratense	20	*Rosa woodsii*	T
Agropyron repens	20	*Symphoricarpos albus*	T
Taraxacum officinale	P	*Agrostis alba*	10
Cirsium arvense	P	*Festuca pratensis*	30
Rumex crispus	T	*Centaurea maculosa*	P

COMMENTS/PROBLEMS: Areas of pre-existing upland pasture. Two stated listed noxious weeds (*Centaurea maculosa* & *Cirsium arvense*) found in this type. This area incorporates planting units along the edge of the C.T # 8 near the river.

Community No.: _7__ Community Title (main species): Phalaris

Dominant Species	% Cover	Dominant Species	% Cover
Populus trichocarpa	10	*Taraxacum officinale*	P
Salix exigua	P	*Hypericum perforatum*	P
Rumex crispus	10		
Agrostis alba	P		
Phalaris arundinacea	80		

COMMENTS/PROBLEMS: This area receives seasonal flooding and is adjacent to river. This site has experienced heavy grazing in the past. Removal of livestock grazing has left a vigorous canary reedgrass population. *Populus trichocarpa* seedlings established in 2002 are increasing in cover and density. Average sapling height 3-4 feet tall. A new state listed noxious weed, *Hypericum perforatum* was observed within the Community Type during 2004 monitoring.

Additional Activities Checklist:
_X_ Record and map vegetative communities on air photo

COMMENTS:

VEGETATION COMMUNITIES

Community No.: _8__ Community Title (main species): Agropyron / Plantago

Dominant Species	% Cover	Dominant Species	% Cover
Plantago major	P	*Agropyron repens*	10
Plantago lanceolata	10	*Chrysanthemum leucanthemum*	T
Verbascum thapsus	T	*Centaurea maculosa*	P
Populus trichocarpa	10	*Agrostis alba*	10
Sisymbrium altissimum	T	*Linaria dalmatica*	T
Artemisia ludoviciana	P		

COMMENTS/PROBLEMS: Area adjacent to Flathead River, cobble and gravel substrate. Community type #8 considered Waters of the U.S. Increasing vegetation cover, mostly invasive or disturbance related species. Size and height of *Populus trichocarpa* saplings increased. Manual weed control activities; cutting & mowing of *Agropyron repens* and *Sisymbrium altissimum* near plantings areas.

Community No.: _9__ Community Title (main species): Bromus

Dominant Species	% Cover	Dominant Species	% Cover
Centaurea maculosa	T	*Chenopodium album*	P
Sisymbrium altissimum	T	*Bromus* spp.	50
Lepidium perfoliatum	T	*Bromus tectorum*	10
Malva neglecta	T	*Agropyron repens*	10

COMMENTS/PROBLEMS: Area previously dominated by *Centaurea maculosa* in 2003. Weed control activities have been conducted to eradicate invasive species within the community type. Increase in *Bromus tectorum* and other brome species following control activities.

Community No.: _10__ Community Title (main species): Populus / Crataegus

Dominant Species	% Cover	Dominant Species	% Cover
Crataegus douglasii	20	*Festuca pratensis*	P
Prunus americana	10	*Phleum pratense*	P
Rosa woodsii	P	*Agropyron repens*	20
Cornus stolonifera	P	*Symphoricarpos albus*	P
Populus trichocarpa	30	*Centaurea maculosa*	P

COMMENTS/PROBLEMS: Mature *Populus trichocarpa* & *Crataegus douglasii* found along higher terrace, adjacent to river & backwater channel. Understory layer consisting of pasture grasses and some invasive species. A few small shrub patches present along backwater channel.

Additional Activities Checklist:
_X_ Record and map vegetative communities on air photo

COMMENTS:

VEGETATION COMMUNITIES

Community No.: _11__ Community Title (main species): Ceratophyllum

Dominant Species	% Cover	Dominant Species	% Cover
Ceratophyllum demersum	40		T
Equisetum hyemale	P		P
Eleocharis acicularis	P		T
Juncus balticus	P		
Phalaris arundinacea	T		

COMMENTS/PROBLEMS: Aquatic bed habitat dominated by *Ceratophyllum demersum*, standing water in channel. Some evidence of flowing water through channel during seasonal high water: scour marks, drift lines and sediment depositions.

Community No.: _12_ Community Title (main species): Juncus / Eleocharis

Dominant Species	% Cover	Dominant Species	% Cover
Juncus ensifolius	20	*Rumex crispus*	T
Eleocharis palustris	10	Willow sprigs (*Salix*)	P
Agrostis alba	10	*Prunella vulgaris*	T
Phalaris arundinacea	10	*Cirsium arvense*	T
Eleocharis acicularis	P		
Scirpus acutus	T		

COMMENTS/PROBLEMS: Emergent wetland vegetation type developing along the fringes of excavated wetland. Shrub plantings installed during spring 2003 and 2004 along excavated wetland fringe. Increase in wetland species diversity along wetland fringe. Invasive species, *Cirsium arvense* observed during 2004 monitoring.

Community No.: 13 Community Title (main species): Phalaris / Agrostis

Dominant Species	% Cover	Dominant Species	% Cover
Phalaris arundinacea	30	*Agropyron repens*	P
Agrostis alba	20		
Eleocharis palustris	T		
Alopecurus pratensis	T		
Plantago major	P		

COMMENTS/PROBLEMS: Small area of vegetation developing in the dry backwater channel consisting of mostly cobble substrate. New area of Community Type # 13 located around the upper side slopes of excavated wetland.

Additional Activities Checklist:
_X_ Record and map vegetative communities on air photo

VEGETATION COMMUNITIES

Community No.: 14 Community Title (main species): Agrostis / Poa

Dominant Species	% Cover	Dominant Species	% Cover
Agrostis alba	60	*Phleum pratense*	T
Poa pratensis	20	*Agropyron repens*	P
Taraxacum officinalis	P	*Cirsium arvense*	T
Festuca pratensis	T		
Trifolium pratense	P		
Plantago lanceolata	10		

COMMENTS/PROBLEMS: Area of pre-existing pasture undisturbed during construction efforts. Removal of livestock has allowed the dominant species to flourish and the be identified for community type mapping.

Additional Activities Checklist:

_X_ Record and map vegetative communities on air photo

COMPREHENSIVE VEGETATION LIST

Species	Vegetation Community Number(s)	Species	Vegetation Community Number(s)
Acer negundo	10	*Juncus ensifolius*	4,5,12

Festuca pratensis	6,15	*Scirpus validus*	2
Eroduim cicutarium	4,8,10	*Sisymbrium altissimum*	6,8,9,14
Gnaphalium palustre	4,8	*Solidago missouriensis*	10
Helianthus annuus	4	*Symphoricarpos albus***	6,10
Hippuris vulgaris	2	*Taraxacum officinalis*	4,6,7,8,15
Hypericum perforatum	7	***Trifolium pratense***	15
Iris pseudacorus	5	*Verbascum thapsus*	4,6,8
Juncus balticus	5,11,12	*Veronica americana*	12

* Species planted during 2003 & 2004 riparian vegetation enhancements.

** Species observed during vegetation survey and also planted during 2003 &2004 riparian vegetation enhancements.

Bolded species new to the list for 2004.

COMMENTS/PROBLEMS: Eleven species were added to the list for 2004. These included two state listed noxious weeds; *Hypericum perforatum* & *Linaria dalmatica*. Also, three herbaceous wetland species planted along the excavated wetland fringe; *Carex bebbiana*, *Carex nebrascensis* and *Carex utriculata*.

PLANTED WOODY VEGETATION SURVIVAL

Species	Number Originally Planted	Number Observed	Mortality Causes
Alnus incana		21	
Amelanchier alnifolia		23	
Betula occidentalis		9	
Cornus stolonifera		74	
Crataegus douglasii		33	
Juniperus scopulorum		-	
Pinus ponderosa		-	
Populus tremuloides		3	
Populus trichocarpa		22	
Prunus americana		29	
Rosa woodsii		49	
Salix bebbiana		3	
Salix exigua		298	
Symphoricarpos albus		-	

COMMENTS/PROBLEMS: The above species were planting during the spring of 2003 and 2004. The results are for species found along transect assesses by LWC and do not reflect the total of number of species planted. Refer to **Appendix G** for the total number of plants installed. **Appendix G** also includes more intensive shrub density monitoring conducted by **SKC** during the summer of 2004.

Were man-made nesting structures installed? Yes____ No _X_ Type:_____ How many?_____ Are the nesting structures being utilized? Yes____ No____ Do the nesting structures need repairs? Yes____ No____

MAMMALS AND HERPTILES

Species	Number Observed	Indirect indication of use			
		Tracks	Scat	Burrows	Other
Deer		X			

Additional Activities Checklist:
__X_ Macroinvertebrate sampling (if required)

COMMENTS/PROBLEMS: Macroinvertebrate samples collected and location marked on map.

PHOTOGRAPHS

Using a camera with a 50 mm lenses and color film take photographs of the following permanent reference points listed in the checklist below. Record the direction of the photograph using a compass. (The first time at each site establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3' above ground, survey the location with a resource grade GPS and mark the location on the air photo.)
Checklist:

__X__ One photo for each of the 4 cardinal directions surrounding wetland
__X__ At least one photo showing upland use surrounding wetland – if more than one upland use exists, take additional photos
__X__ At least one photo showing buffer surrounding wetland
__X__ One photo from each end of vegetation transect showing transect

Location	Photo	Photograph Description	Compass Reading
1	1	Picture looking S. at upland, emergent vegetation and open water area.	180^o
2	2	Picture looking N. at emergent vegetation and open water area.	180^o
3	3	Picture looking E. at emergent vegetation that existed before construction.	90^o
4	4	Panoramic view running W. to E., created open water area.	$315^o – 135^o$
5	5	Picture looking E. at backwater side channel.	90^o
6	6	Panoramic view running W. to E., emergent wetlands, open water area & upland.	$315^o – 90^o$
7	7	Picture looking E. at side channel & area where berm was removed.	90^o
8	8	Picture looking E. at side channel & area of high water disturbance.	90^o
9	9a	Picture looking W. at upland, emergent wetlands & created open water areas.	315^o
9	9b	Picture looking N. at upland pasture.	0^o
9	9c	Picture looking S. at riparian vegetation along side channel.	180^o
10	10	Picture looking W. at inlet to backwater side channel.	$270^o –135^o$
11	11	Picture looking NW. along N. side of project boundary & Flathead River.	315^o
12	12	Picture looking NW. along N. side of site, areas where berm was removed.	315^o
13	13	Picture looking W. at empty floodplain channel near river.	315^o

COMMENTS/PROBLEMS: All pictures were taken with a digital camera.

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points with the GPS unit set at 5 second recording rate. Record file numbers fore site in designated GPS field notebook

Checklist:

__X__ Jurisdictional wetland boundary
__X__ 4-6 landmarks recognizable on the air photo
__X__ Start and end points of vegetation transect(s)
__X__ Photo reference points
_____ Groundwater monitoring well locations

COMMENTS/PROBLEMS: _____

_____

_____

WETLAND DELINEATION

At each site conduct the items on the checklist below:
__X__Delineate wetlands according to the 1987 Army Corps manual.
__X__Delineate wetland-upland boundary on the air photo
_____ Survey wetland-upland boundary with a resource grade GPS survey

COMMENTS/PROBLEMS: _____

FUNCTIONAL ASSESSMENT

See attached completed MDT Montana Wetland Assessment Method forms.

MAINTENANCE

Were man-made nesting structures installed at this site? YES ___ NO __X__
If yes, do they need to be repaired? YES____ NO____
If yes, describe problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures build or installed to impound water or control water flow into or out of the wetland? YES____ NO _X_
If yes, are the structures working properly and in good working order? YES____ NO___
If no, describe the problems below.

COMMENTS/PROBLEMS: _____

MDT WETLAND MONITORING – VEGETATION TRANSECT

Site: Hoskins Landing Date: 07/21/04 Examiner: Greg Howard Transect # 1

Approx. transect length: 390 ft Compass Direction from Start (Upland): 45°

Vegetation type 1:	Festuca/Phleum (Community No. 6)	
Length of transect in this type:	45	feet
Species:		Cover:
Plantago lanceolata		T
Cirsium arvense		T
Agrostis alba		20
Phleum pratense		P
Festuca pratensis		40
Agropyron repens		P
Rumex crispus		T

LAND & WATER

MDT WETLAND MONITORING – VEGETATION TRANSECT (back of form)

Cover Estimate		**Indicator Class:**	**Source:**
+ = <1%	3 = 11-20%	+ = Obligate	P = Planted
1 = 1-5%	4 = 21-50%	- = Facultative/Wet	V = Volunteer
2 = 6-10%	5 = >50%	0 = Facultative	

Percent of perimeter _____ % developing wetland vegetation – excluding dam/berm structures.

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 food depth (in open water), or at a point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 ft wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

Notes:

BIRD SURVEY – FIELD DATA SHEET

Page 1 of 1
Date: 7/21/04

SITE: Hoskins Landing

Survey Time: 9:00 – 4:00

Bird Species	#	Behavior	Habitat	Bird Species	#	Behavior	Habitat
Black & White Warbler	5	N	SS				
Field Sparrow	2	BD	UP				
Red-winged Blackbird	8	N	MA				

Notes: Conditions: Mostly overcast with light wind, approximately 80 degrees.
.
Not many birds using site during visit.

Behavior: BP – one of a breeding pair; BD – breeding display; F – foraging; FO – flyover; L – loafing; N – nesting

Habitat: AB – aquatic bed; FO – forested; I – island; MA – marsh; MF – mud flat; OW – open water; SS – scrub/shrub; UP – upland buffer; WM – wet meadow, US – unconsolidated shoreline

7				15			
8				16			

Percent of Dominant Species that are OBL, FACW, or FAC (excluding FAC-). 2/6 = 33%

Upland pasture along the outer fringes of excavated wetland slopes.

HYDROLOGY

___ Recorded Data (Describe in Remarks):
- ___ Stream, Lake, or Tide Gauge
- ___ Aerial Photographs
- ___ Other

X No Recorded Data Available

Field Observations:

Depth of Surface Water: - (in.)

Depth to Free Water in Pit: - (in.)

Depth to Saturated Soil: - (in.)

Wetland Hydrology Indicators:

Primary Indicators:
- ___ Inundated
- ___ Saturated in Upper 12 Inches
- ___ Water Marks
- ___ Drift Lines
- ___ Sediment Deposits
- ___ Drainage Patterns in Wetlands

Secondary Indicators (2 or more required):
- ___ Oxidized Root Channels in Upper 12 Inches
- ___ Water-Stained Leaves
- ___ Local Soil Survey Data
- ___ FAC-Neutral Test
- ___ Other (Explain in Remarks)

Remarks:
No evidence of hydrology. Soil dry and crumbly, not saturated or moist at the time of inspection.

LAND & WATER

SOILS

Map Unit Name (Series and Phase): Horseplains-riverwash complex

Drainage Class: _____

Taxonomy (Subgroup): _____

Field Observations

Confirm Mapped Type? X Yes _____ No

Profile Description:

11. ESTIMATED RELATIVE ABUNDANCE (of similarly classified sites within the same Major Montana Watershed Basin)
Common **Comments:** _____

12. GENERAL CONDITION OF AA

i. Regarding Disturbance: (Use matrix below to select appropriate response.)

	Predominant Conditions Adjacent (within 500 Feet) To AA		
Conditions Within AA	Land managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings.	Land not cultivated, but moderately grazed or hayed or selectively logged or has been subject to minor clearing; contains few roads or buildings.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density.
AA occurs and is managed in predominantly a natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings.	---	---	---
AA not cultivated, but moderately grazed or hayed or selectively logged or has been subject to relatively minor clearing, or fill placement, or hydrological alteration; contains few roads or buildings.	---	moderate disturbance	---
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density.	---	---	---

Comments: (types of disturbance, intensity, season, etc.) Historic livestock grazing, cattle have been removed.

ii. Prominent weedy, alien, & introduced species: Spotted Knapweed, Canadian thistle, bull thistle, hound's tongue, common dandelion & quackgrass.

iii. Briefly describe AA and surrounding land use / habitat: Area of heavy alteration from livestock grazing. AA had several small wetlands and an active backwater channel. Surrounding lands are used for croplands & livestock.

13. STRUCTURAL DIVERSITY (Based on 'Class' column of #10 above.)

Number of 'Cowardin' Vegetated Classes Present in AA	≥3 Vegetated Classes or ≥ 2 if one class is forested	2 Vegetated Classes or 1 if forested	≤ 1 Vegetated Class
Select Rating	High	---	---

14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

Primary or Critical habitat **(list species)**	☐ D ☐ S	_____
Secondary habitat **(list species)**	☐ D ☒ S	Bald Eagle
Incidental habitat **(list species)**	☐ D ☒ S	Gray wolf & bull trout
No usable habitat	☐ D ☒ S	Spalding's campion, grizzly bear & Canada lynx

ii. **Rating** (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	.7 (M)	---	---	---

If documented, list the source (e.g., observations, records, etc.)**:** _____

14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.
Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

Primary or Critical habitat **(list species)**	☐ D ☐ S	_____
Secondary habitat **(list species)**	☐ D ☐ S	_____
Incidental habitat **(list species)**	☐ D ☒ S	Boreal toad & peregrine falcon
No usable habitat	☐ D ☐ S	_____

iii. **Rating** (Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level:	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.1 (L)	---

If documented, list the source (e.g., observations, records, etc.)**:** _____

14C. General Wildlife Habitat Rating

i. **Evidence of overall wildlife use in the AA:** (Check either substantial, moderate, or low)

☐ **Substantial** (based on any of the following)
- ☐ observations of abundant wildlife #s or high species diversity (during any period)
- ☐ abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
- ☐ presence of extremely limiting habitat features not available in the surrounding area
- ☐ interviews with local biologists with knowledge of the AA

☐ **Low** (based on any of the following)
- ☐ few or no wildlife observations during peak use periods
- ☐ little to no wildlife sign
- ☐ sparse adjacent upland food sources
- ☐ interviews with local biologists with knowledge of AA

☒ **Moderate** (based on any of the following)
- ☐ observations of scattered wildlife groups or individuals or relatively few species during peak periods
- ☒ common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
- ☒ adequate adjacent upland food sources
- ☐ interviews with local biologists with knowledge of the AA

ii. **Wildlife Habitat Features** (Working from top to bottom, select appropriate AA attributes to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from #13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see #10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A= absent.

Structural Diversity (from #13)	☒High								☐Moderate								☐Low			
Class Cover Distribution (all vegetated classes)	☒Even				☐Uneven				☐Even				☐Uneven				☐Even			
Duration of Surface Water in ≥ 10% of AA	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Low disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see #12)	H	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
High disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. **Rating** (Using 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.)

Evidence of Wildlife Use from 14C(i)	**Wildlife Habitat Features Rating** from 14C(ii)			
	☐ Exceptional	☒ High	☐ Moderate	☐ Low
Substantial	--	--	--	--
Moderate	--	.7 (M)	--	--
Low	--	--	--	--

Comments: _____

LAND & WATER

14D. GENERAL FISH/AQUATIC HABITAT RATING ☐ **NA** (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.
Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [*e.g.* fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (*e.g.* fish use within an irrigation canal], then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.

Duration of Surface Water in AA	☒Permanent/Perennial			☐Seasonal / Intermittent			☐Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (*e.g.* submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading – 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	M	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity **or** is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support**?**
☐ **Y** ☒ **N** If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: ☐ E ☐ H ☐ M ☐ L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	**Modified Habitat Quality** from 14D(ii)			
	☐ Exceptional	☐ High	☒ Moderate	☐ Low
Native game fish	--	--	--	--
Introduced game fish	--	--	.6 (M)	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: AA has in the past been altered by man-made berms, head gates & grading. These features were removed to restore connection.

14E. FLOOD ATTENUATION ☐ **NA** (proceed to 14G)
Applies only to wetlands subject to flooding via in-channel or overbank flow.
If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	☐ ≥ 10 acres			☒ <10, >2 acres			☐ ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains **no outlet or restricted outlet**	--	--	--	--	--	.5 (M)	--	--	--
AA contains **unrestricted outlet**	--	--	--	--	--	--	--	--	--

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check)
☐**Y** ☒**N** **Comments:** AA is historic floodplain of Flathead River.

14F. SHORT AND LONG TERM SURFACE WATER STORAGE ☐ **NA** (proceed to 14G)
Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.
If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. Rating (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)
Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	☒ >5 acre feet			☐ <5, >1 acre feet			☐ ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond **≥ 5 out of 10 years**	--	.9 (H)	--	--	--	--	--	--	--
Wetlands in AA flood or pond **< 5 out of 10 years**	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL ☐ **NA** (proceed to 14H)
Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.
If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants **or** AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
% cover of wetland vegetation in AA	☐ ≥ 70%		☐ < 70%		☒ ≥ 70%		☐ < 70%	
Evidence of flooding or ponding in AA	☐ Yes	☐ No	☐ Yes	☐ No	☒ Yes	☐ No	☐ Yes	☐ No
AA contains **no or restricted outlet**	--	--	--	--	.5 (M)	--	--	--
AA contains **unrestricted outlet**	--	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/SHORELINE STABILIZATION ☐ **NA** (proceed to 14I)

Applies only if AA occurs on or within the banks or a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding root masses.	***Duration of Surface Water Adjacent to Rooted Vegetation***		
	☐Permanent / Perennial	☒Seasonal / Intermittent	☐Temporary / Ephemeral
≥ 65 %	--	--	--
35-64 %	--	--	--
< 35 %	--	.2 (L)	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.
A = acreage of vegetated component in the AA. **B** = structural diversity rating from #13. **C** = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; **P/P** = permanent/perennial; **S/I** = seasonal/intermittent; **T/E/A**= temporary/ephemeral/absent.

A	☒ Vegetated component >5 acres						☐ Vegetated component 1-5 acres						☐ Vegetated component <1 acre					
B	☒ High		☐ Moderate		☐ Low		☐ High		☐ Moderate		☐ Low		☐ High		☐ Moderate		☐ Low	
C	☒Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N
P/P	1H	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

T/E/A	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. ☒ **Discharge Indicators**
- ☐ Springs are known or observed.
- ☐ Vegetation growing during dormant season/drought.
- ☐ Wetland occurs at the toe of a natural slope.
- ☐ Seeps are present at the wetland edge.
- ☒ AA permanently flooded during drought periods.
- ☐ Wetland contains an outlet, but no inlet.
- ☐ Other _____

ii. ☒ **Recharge Indicators**
- ☒ Permeable substrate presents without underlying impeding layer.
- ☐ Wetland contains inlet but not outlet.
- ☐ Other _____

iii. **Rating:** Use the information from 14J(i) and 14j(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: _____

14K. UNIQUENESS

i. Rating (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP.			AA does not contain previously cited rare types or associations and structural diversity (#13) is low-moderate.		
Estimated Relative Abundance from #11	☐rare	☐common	☐abundant	☐rare	☒common	☐abundant	☐rare	☐common	☐abundant

LAND & WATER

14D. GENERAL FISH/AQUATIC HABITAT RATING ☒ **NA** (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.
Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [*e.g.* fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (*e.g.* fish use within an irrigation canal], then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.

Duration of Surface Water in AA	☐ Permanent/Perennial			☐ Seasonal / Intermittent			☐ Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (*e.g.* submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading – 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity **or** is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support**?**
☐ **Y** ☐ **N** If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: ☐ E ☐ H ☐ M ☐ L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	**Modified Habitat Quality** from 14D(ii)			
	☐ Exceptional	☐ High	☐ Moderate	☐ Low
Native game fish	--	--	--	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: _____

14E. FLOOD ATTENUATION ☐ **NA** (proceed to 14G)
Applies only to wetlands subject to flooding via in-channel or overbank flow.
If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	☐ ≥ 10 acres			☐ <10, >2 acres			☒ ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains **no outlet or restricted outlet**	--	--	--	--	--	--	--	--	.2 (L)
AA contains **unrestricted outlet**	--	--	--	--	--	--	--	--	--

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check)
☐**Y** ☐**N** **Comments:** Rarely floods, but does likely occur on occasion.

14F. SHORT AND LONG TERM SURFACE WATER STORAGE ☐ **NA** (proceed to 14G)
Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.
If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. Rating (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)
Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	☐ >5 acre feet			☐ <5, >1 acre feet			☒ ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond **≥ 5 out of 10 years**	--	--	--	--	--	--	--	.3 (L)	--
Wetlands in AA flood or pond **< 5 out of 10 years**	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL ☐ **NA** (proceed to 14H)
Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.
If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants **or** AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
% cover of wetland vegetation in AA	☐ ≥ 70%		☐ < 70%		☒ ≥ 70%		☐ < 70%	
Evidence of flooding or ponding in AA	☐ Yes	☐ No	☐ Yes	☐ No	☒ Yes	☐ No	☐ Yes	☐ No
AA contains **no or restricted outlet**	--	--	--	--	.5 (M)	--	--	--
AA contains **unrestricted outlet**	--	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/SHORELINE STABILIZATION ☒ **NA** (proceed to 14I)

Applies only if AA occurs on or within the banks or a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	***Duration of Surface Water Adjacent to Rooted Vegetation***		
	☐Permanent / Perennial	☐Seasonal / Intermittent	☐Temporary / Ephemeral
≥ 65 %	--	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.
A = acreage of vegetated component in the AA. **B** = structural diversity rating from #13. **C** = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; **P/P** = permanent/perennial; **S/I** = seasonal/intermittent; **T/E/A**= temporary/ephemeral/absent.

A	☐ Vegetated component >5 acres						☐ Vegetated component 1-5 acres						☒ Vegetated component <1 acre					
B	☐ High		☐ Moderate		☐ Low		☐ High		☐ Moderate		☐ Low		☐ High		☐ Moderate		☒ Low	
C	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☐N	☐Y	☒N
P/P	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
S/I	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	.2L
T/E/A	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. ☒ **Discharge Indicators**
- ☐ Springs are known or observed.
- ☐ Vegetation growing during dormant season/drought.
- ☐ Wetland occurs at the toe of a natural slope.
- ☒ Seeps are present at the wetland edge.
- ☐ AA permanently flooded during drought periods.
- ☐ Wetland contains an outlet, but no inlet.
- ☒ Other _____

ii. ☐ **Recharge Indicators**
- ☐ Permeable substrate presents without underlying impeding layer.
- ☐ Wetland contains inlet but not outlet.
- ☐ Other _____

iii. **Rating:** Use the information from 14J(i) and 14j(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: Likely discharges groundwater through alluvium.

14K. UNIQUENESS

i. Rating (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP.			AA does not contain previously cited rare types or associations and structural diversity (#13) is low-moderate.		
Estimated Relative Abundance from #11	☐rare	☐common	☐abundant	☐rare	☐common	☐abundant	☐rare	☒common	☐abundant
Low disturbance at AA (#12i)	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (#12i)	--	--	--	--	--	--	--	.3L	--
High disturbance at AA (#12i)	--	--	--	--	--	--	--	--	--

Comments: _____

14L. RECREATION / EDUCATION POTENTIAL

i. Is the AA a known recreational or educational site? ☐ **Yes (Rate** ☐ **High (1.0)**, then proceed to 14L(ii) only] ☒ **No** [Proceed to 14L(iii)]

ii. Check categories that apply to the AA: ☐ Educational / scientific study ☐ Consumptive rec. ☐ Non-consumptive rec. ☐ Other

iii. Based on the location, diversity, size, and other site attributes, is there a strong potential for recreational or educational use?
☐ **Yes** [Proceed to 14L (ii) and then 14L(iv).] ☒ **No** [Rate as low in 14L(iv)]

iv. Rating (Use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Ownership	Disturbance at AA from #12(i)		
	☐ Low	☐ Moderate	☐ High
Public ownership	--	--	--
Private ownership	--	--	.1(L)

LAND & WATER

Photo Point No. 1: View looking south along vegetation transect. Foreground consisting of upland slopes seeded with native grass species.

Photo Point No. 2: View looking south towards excavated wetland and emergent wetlands.

Photo Point No. 3: View looking east, excavated wetland, adjacent to undisturbed emergent wetlands. Emergent vegetation expanding into inundated portions of excavated wetland.

Photo Point No. 4: View looking north across the mitigation site. Western side of excavated wetland with aquatic bed and emergent wetland types, undisturbed wetland located in center.

Photo Point No. 5: View looking east, remnant backwater channel along southern edge of site boundary.

Photo Point No. 7: View looking east near backwater channel. Area of native shrub plantings with browse protection guards over grown with seeded grass and upland species.

Photo Point No. 8: View looking east along backwater channel.

Photo Point No. 9: View looking west, towards excavated wetland. Upland community in foreground and excavated wetland in background.

Photo Point No. 9: View looking north across remnant pasture. Undisturbed areas consisting of mostly upland grasses. Area heavily grazed in the past exhibiting dense vegetation cover.

Photo Point No. 9: View looking south, upland shrub community type consisting of hawthorne, American plum and cottonwood. Located on higher terrace along backwater channel.

Photo Point No. 10: View looking west; inlet to backwater channel on eastern side of mitigation site. Increased vegetation cover observed during 2004 monitoring.

Photo Point No. 11: View looking northwest along the Flathead river banks. Increase in vegetation cover, area dominated by reed canarygrass and redtop. Electric fence established to exclude livestock grazing.

Photo Point No. 12: View looking northwest along Flathead River. Area of excavation and grading work to remove historic berm along north boundary of site during 2002.

Photo Point No. 13: View looking west along backwater flood channel. Substrate of cobbles and gravels with increasing vegetation cover. Cottonwood saplings observed during 2004 monitoring. Area establishing with dense vegetation cover.

Photo Point No. 6: Panoramic view looking northwest; area of upland grass community in foreground and excavated wetland in background. Emergent wetland vegetation developing around excavated wetland fringe.

Hoskins Landing: 2004

Photo Point No. 6: Panoramic view looking northeast; area of upland grass community in foreground and excavated wetland in background.

Photo Point No. 4: Panoramic view looking north across the mitigation site. Western side of excavated wetland, aquatic bed and emergent wetland types, undisturbed wetland located in center. Outlet to remnant backwater channel located on left side of photo. Transect located along western side of excavated wetland. Emergent vegetation developing dense cover around excavated wetland fringe.

TABLE OF CONTENTS

NOTES

CONSTRUCTION ACCESS

THE CONTRACTOR IS RESPONSIBLE FOR REVEGETATING ALL DISTURBED ACCESS AND STAGING AREAS.

WETLAND TOPSOIL

EXCAVATE WETLAND TOPSOIL FROM WITHIN CONSTRUCTION LIMIT AREAS AND STOCKPILE TOPSOIL IN THE AREAS DESIGNATED ON THE PLANS. PLACE TOPSOIL TO A MINIMUM DEPTH OF 100mm ON ALL DISTURBED AREAS.
FINISHED GRADE ELEVATIONS DO NOT INCLUDE TOPSOIL.

GRADING

PERFORM ALL EXCAVATION AND EMBANKMENTS BY METHODS DESCRIBED IN SECTION 203 OF THE STANDARD SPECIFICATIONS. ALL EXCAVATION INCLUDING MUCK EXCAVATION AND DISPOSAL OF EXCESS MATERIAL WILL BE PAID FOR AS "UNCLASSIFIED EXCAVATION". EXCAVATION OF SATURATED MATERIAL IS ANTICIPATED IN SOME AREAS, HOWEVER NO PAYMENT WILL BE MADE FOR MUCK EXCAVATION. DISPOSE OF EXCESS MATERIAL OFF SITE IN AREA SPECIFIED SOUTHWEST OF THE WETLAND SITE.
ROUND ALL SLOPES 10:1 AND STEEPER

SEEDING

SEED AREAS SHOWN ON THE PLANS AND OTHER AREAS DISTURBED DURING CONSTRUCTION. SEE SPECIAL PROVISIONS FOR SEED MIX TO BE USED ON EACH AREA.

FENCING

PERIMETER FENCING IS STANDARD HOT BARBED 5-WIRE FENCE WITH WOODEN POSTS (TYPE FSW1. PLACE PERIMETER FENCING 0.2 m OUTSIDE THE BOUNDARY DEFINED BY THE CERTIFICATE OF SURVEY (C.O.S. 20701. DO NOT FENCE THE NORTH BOUNDARY ADJACENT TO THE RIVER.

BIRD SURVEY PROTOCOL
GPS PROTOCOL

MDT Wetland Mitigation Monitoring
Hoskins Landing
Dixon, Montana

LAND & WATER

BIRD SURVEY PROTOCOL

The following is an outline of the MDT Wetland Mitigation Site Monitoring Bird Survey Protocol. Though each site is vastly different, the bird survey data collection methods must be standardized to a certain degree to increase repeatability. An Area Search within a restricted time frame will be used to collect the following data: a bird species list, density, behavior, and habitat-type use. There will be some decisions that team members must make to fit the protocol to their particular site. Each of the following sections and the desired result describes the protocol established to reflect bird species use over time.

Species Use within the Mitigation Wetland: Survey Method

Result: To conduct a bird survey of the wetland mitigation site within a restricted period of time and the budget allotment.

Sites that can be circumambulated or walked throughout.

These types of sites will include ponds, enhanced historic river channels, wet meadows, and any area that can be surveyed from the entirety of its perimeter or walked throughout. If the wetland is not uncomfortably inundated, conduct several "meandering" transects through the site in an orderly fashion (record the number and approximate location/direction of the transects in the field notebook; they do not have to be formalized or staked). If a very small portion of the site cannot be crossed due to inundation, this method will also apply. Though the sizes of the site vary, each site will require surveying to the fullest extent possible within a set time limit. The optimum times to conduct the survey are in the morning hours. Conduct the survey from sunrise to no later than 11:00 AM. (Note: some sites may have to be surveyed in the late afternoon or evening due to time constraints or weather; if this is the case, record the time of day and include this information in your report discussion.) If the survey is completed before 11:00 AM and no additions are being made to the list, then the task is complete. The overall limiting factor regarding the number of hours that are spent conducting this survey is the number of budgeted hours; this determination must be made by site by each individual.

In many cases, binoculars will be the only instrument that is needed to identify and count the birds using the wetland. If the wetland includes deep water habitat that can not be assessed with binoculars, then a scope and tripod are necessary. If this is the case, establish as many lookout posts as necessary from key vantage points to collect the data. Depending on the size of the open water, more time may be spent viewing the mitigation area from these vantage points than is spent walking the peripheries of more shallow-water wetlands.

Sites that cannot be circumambulated.

These types of sites will include large-bodied waters, such as reservoirs, particularly those with deep water habitat (>6 ft) close to the shore and no wetland development in that area of the shoreline. If one area of the reservoir was graded in such a way to create or enhance the development of a wetland, then that will be the area in which the ambulatory bird survey is conducted. The team member must then determine the length of the shoreline that will be surveyed during each visit.

As stated above in the ambulatory site section, these large sites most likely will have to be surveyed from established vantage points.

Species Use within the Mitigation Wetland: Data Recording

Result: A complete list of bird species using the site, an estimate of bird densities and associated behaviors, and identification of habitat use.

1. Bird Species List

Record the bird species on the Bird Survey - Field Data Sheet using the appropriate 4-letter code of the common name. The coding uses the first two letters of the first two words of the birds' common name or if one name, the first four (4) letters. For example, mourning dove is coded MODO and mallard is MALL. If an unknown individual is observed, use the following protocol and define your abbreviation at the bottom of the field data sheet: unknown shorebird: UNSB; unknown brown bird (UNBR); unknown warbler (UNWA); unknown waterfowl (UNWF). For a flyover of a flock of unknown species, use a term that describes the birds' general characteristics and include the approximate flock size in parentheses; do not fill in the habitat column. For example, a flock of black, medium-sized birds could be coded: UNBB / FO (25). You may also note on the data sheet if that particular individual is using a constructed nest box.

2. Bird Density

In the office, sum the Bird Survey – Field Data Sheet data by species and by behavior. Record this data in the Bird Summary Table.

3. Bird Behavior

Bird behavior must be identified by what is known. When a species is simply observed, the behavior that it is immediately exhibiting is what is recorded. Only behaviors that have discreet descriptive terms should be used. The following terms are recommended: breeding pair individual (BP); foraging (F); flyover (FO); loafing (L; e.g. sleeping, roosting, floating with head tucked under wing are loafing behaviors); and, nesting (N). If more behaviors are observed that do have a specific descriptive word, use them and we will add it to the protocol; descriptive words or phrases such as "migrating" or "living on site" are unknown behaviors.

4. Bird Species Habitat Use

We are interested in what bird species are using which particular habitat within the mitigation wetlands. This data is easily collected by simply recording what habitat the species was initially observed. Use the following broad category habitat classifications: aquatic bed (AB - rooted floating, floating-leaved, or submergent vegetation); forested (FO); marsh (MA – cattail, bulrush, emergent vegetation, etc. with surface water); open water (OW – primarily unvegetated); scrub-shrub (SS); and upland buffer (UP); wet meadow (WM – sedges, rushes, grasses with little to no surface water). If other categories are observed onsite that are not suggested here, we will make a new category next year.

GPS Mapping and Aerial Photo Referencing Procedure

The wetland boundaries, photograph location points and sampling locations were field located with mapping grade Trimble Geo III GPS units. The data was collected with a minimum of three positions per feature using Course/Acquisition code. The collected data was then transferred to a PC and differentially corrected to the nearest operating Community Base Station. The corrected data was then exported to ACAD drawings in Montana State Plain Coordinates NAD 83 international feet.

The GPS positions collected and processed had a 68% accuracy of 7 feet except in isolated areas of Tasks .008 and .011, where it went to 12 feet. This is within the 1 to 5 meter range listed as the expected accuracy of the mapping grade Trimble GPS.

Aerial reference points were used to position the aerial photographs. This positioning did not remove the distortion inherent in all photos; this imagery is to be used as a visual aide only. The located wetland boundaries were given a final review by the wetland biologist and adjustments were made if necessary.

Any relationship of features located to easement or property lines are not to be construed from these figures. These relationships can only be determined with a survey by a licensed surveyor.

Appendix F

MACROINVERTEBRATE SAMPLING PROTOCOL AND DATA

MDT Wetland Mitigation Monitoring
Hoskins Landing
Dixon, Montana

LAND & WATER

AQUATIC INVERTEBRATE SAMPLING PROTOCOL

Equipment List

- D-frame sampling net with 1 mm mesh. Wildco is a good source of these.
- Spare net.
- 1-liter plastic sample jars, wide-mouth. VWR has these: catalog #36319-707.
- 95% ethanol: Northwest Scientific in Billings carries this.

All these other things are generally available at hardware or sporting goods stores. Make the labels on an ink jet printer preferably.

- hip waders.
- pre-printed sample labels (printed on Rite-in-the-Rain or other coated paper, two labels per sample).
- pencil.
- plastic pail (3 or 5 gallon).
- large tea strainer or framed screen.
- towel.
- tape for affixing label to jar.
- cooler with ice for sample storage.

Site Selection

Select the sampling site with these considerations in mind:

- Select a site accessible with hip waders. If substrates are too soft, lay a wide board down to walk on.
- Determine a location that is representative of the overall condition of the wetland.

Sampling

Wetland invertebrates inhabit the substrate, the water column, the stems and leaves of aquatic vegetation, and the water surface. Your goal is to sweep the collecting net through each of these habitat types, and then to combine the resulting samples into the 1-liter sample jar.

Dip out about a gallon of water into the pail. Pour about a cup of ethanol into the sample jar. Fill out the top half of the sample labels, using pencil, since ink will dissolve in the ethanol.

Ideally, you can sample a swath of water column from near-shore outward to a depth of approximately 3 feet with a long sweep of the net, keeping the net at about half the depth of the water throughout the sweep. Sweep the water surface as well. Pull the net through a vegetated area, beneath the water surface, for at least a meter of distance.

Sample the substrate by pulling the net along the bottom, bumping it against the substrate several times as you pull.

This step is optional, but it gives you a chance to <u>see</u> that you've collected some invertebrates. Rinse the net out into the bucket, and look for insects, crustaceans, etc. If

necessary, repeat the sampling process in a nearby location, and add the net contents to the bucket. Remember to sample all four environments.

Sieve the contents of the bucket through the straining device and pour or carefully scrape the contents of the strainer into the sample jar.

If you skip the bucket-and-sieve steps, simply lift handfuls of material out of the sampling net into the jars. In either case, please include some muck or mud and some vegetation in the jar. Often, you will have collected a large amount of vegetable material. If this is the case, lift out handfuls of material from the sieve into the jar, until the jar is about half full. Please limit material you include in the sample, so that there is only a single jar for each sample.

Top off the sample jar with enough ethanol to cover all the material in the jar. Leave as little headroom as possible.

It is not necessary to sample habitats in any specified order. Keep in mind that disturbing the habitats prior to sampling will chase off the animals you are trying to capture.

Complete the sample labels. Place one label inside the sample jar and tape the other label securely to the outside of the jar. Dry the jar before attaching the outer label if necessary. In some situations, it may be necessary to collect more than one sample at a site. If you take multiple samples from the same site, clearly indicate this by using individual sample numbers, along with the total number of samples collected at the site (e.g. Sample #3 of 5 total samples).

Photograph the sampled site.

Sample Handling/Shipping

- In the field, keep collected samples cool by storing them in a cooler. Only a small amount of ice is necessary.
- Inventory all samples, preparing a list of all sites and enumerating all samples, before shipping or delivering to the laboratory.
- Deliver samples to Rhithron.

MDT Wetland Mitigation Monitoring Project
Aquatic Invertebrate Monitoring
Summary 2001 - 2004

METHODS

Among other monitoring activities, aquatic invertebrate assemblages were collected at a number of mitigation wetlands throughout Montana. This report summarizes data generated from four years of collection.

The method employed to assess these wetlands is based on constructing an index using a battery of 12 bioassessment metrics or attributes (Table1) tested and recommended by Stribling et al. (1995) in a report to the Montana Department of Health and Environmental Science. In that study, it was determined that some of the metrics were of limited use in some geographic regions, and for some wetland types. Despite that finding, all 12 metrics are used in this evaluation of mitigated wetlands, since detailed geographic information and wetland classifications were unavailable.

Scoring criteria for metrics were developed by generally following the tactic used by Stribling et al. Boxplots were generated using a statistical software package, and distributions, median values, ranges, and quartiles for each metric were examined. All sites in all years of sampling were used. Camp Creek, which was sampled in 2002, 2003, and 2004, was assessed using the tested metric battery developed for montane streams of Western Montana (Bollman 1998).The fauna at the Camp Creek site was different from that of the other sites, and suggested montane stream conditions rather than wetland conditions. For the wetlands, "optimal" scores were generally those that fell above the 75th percentile (for those metrics that decrease in value in response to stress) or below the 25th percentile (for metrics that respond to stress by an increase in value) of all scores. Additional scoring ranges were established by bisecting the range below the 75th percentile for decreasing scores (or above the 25th percentile for increasing scores) into "sub-optimal" and "poor" assessment categories. A score of 5, 3, or 1 was assigned to optimal, sub-optimal, and poor metric performance, respectively. In this way, metric values were translated into normalized metric scores, and scores for all metrics were summed to produce a total bioassessment score. Total bioassessment scores were classified according to a similar process, using the ranges and distributions of total scores for all sites studied in all years.

The purpose of constructing an index from biological attributes or metrics is to provide a means of integrating information to facilitate the determination of whether management action is needed. The nature of the action needed is not determined solely by the index score, however, but by consideration of an analysis of the component metrics, the taxonomic composition of the assemblages, and other issues. The diagnostic functions of the metrics and taxonomic data need more study; our understanding of the interrelationships of natural environmental factors and anthropogenic disturbances are tentative. Thus, the further interpretive remarks accompanying the raw taxonomic and metric data are offered cautiously.

Sample processing

Aquatic invertebrate samples were collected at mitigation wetland sites in the summer months of 2001, 2002, 2003, and 2004 by personnel of Land and Water Consulting, Inc. Sampling procedures utilized were based on the protocols developed by the Montana Department of

Environmental Quality (MT DEQ). Sampling consisted of D-frame net sweeps through emergent vegetation (when present), the water column, over the water surface, and included disturbing and scraping substrates at each sampled sites. Samples were preserved in ethanol at each wetland site and subsequently delivered to Rhithron Associates, Inc. for processing, taxonomic determinations, and data analysis.

At Rhithron's laboratory, Caton subsamplers and stereomicroscopes with 10X magnification were used to randomly select a minimum of 100 organisms, when possible, from each sample. In some cases, the entire sample contained fewer than 100 organisms; in these cases, all organisms from the sample were taken. Taxa were identified in general accordance with the taxonomic resolution standards set out in the MT DEQ Standard Operating Procedures for Sampling and Sample Analysis (Bukantis 1998). All samples were re-identified by a second taxonomist for quality assurance purposes. The identified samples have been archived at Rhithron's laboratory. Taxonomic data and organism counts were entered into an Excel 2000 spreadsheet, and metrics were calculated and scored using spreadsheet formulae.

Bioassessment metrics

An index based on the performance of 12 metrics was constructed, as described above. Table 1 lists those metrics, describes their calculation and the expected response of each to increased degradation or impairment of the wetland.

In addition to the summed scores of each metric and the associated impairment classification described above, each individual metric informs the bioassessment to some degree. The four richness metrics (Total taxa, POET, Chironomidae taxa, and Crustacea taxa + Mollusca taxa) can be interpreted to express habitat complexity as well as water quality. Complex, diverse habitats consist of variable substrates, emergent vegetation, variable water depths and other factors, and are potential features of long-established stable wetlands with minimal human disturbance. In the study conducted by Stribling et al. (1995), all four richness metrics were found to be significantly associated with water quality parameters including conductance, salinity, and total dissolved solids.

Four composition metrics (%Chironomidae, %Orthocladiinae of Chironomidae, %Crustacea + %Mollusca, and %Amphipoda) measure the relative contributions of certain taxonomic groups that may have significant responses to habitat and/or water quality impacts. For example, amphipods have been demonstrated to increase in abundance in alkaline conditions. Short-lived, relatively mobile taxa such as chironomids dominate ephemeral environments; many are hemoglobin-bearers capable of tolerating de-oxygenated conditions.

Two tolerance metrics (the Hilsenhoff Biotic Index and %Dominant taxon) were included in the bioassessment battery. The HBI indicates the overall invertebrate assemblage tolerance to nutrient enrichment, warm water, and/or low dissolved oxygen conditions. The percent abundance of the dominant taxon has been demonstrated to be strongly associated with pH, conductance, salinity, total organic carbon, and total dissolved solids.

Two trophic measures (%Collector-gatherers and %Filterers) may be helpful in expressing functional integrity of the invertebrate assemblage, which can be impacted by poor water quality or habitat degradation. High proportions of filtering organisms suggest nutrient and/or organic

enrichment, while abundant collectors suggest more positive functional conditions and well-developed wetland morphology. These organisms graze periphyton growing on stable surfaces such as macrophytes.

RESULTS

In 2001, 29 sites were sampled statewide. Nineteen of these sites were revisited in 2002, and 13 new sites were sampled. In 2003, 17 sites that had been visited in both 2001 and 2002 were re-sampled, and 11 sites sampled for the first time in 2001 were re-visited. In addition, 2 new sites were sampled. In 2004, 25 sites were re-visited, and 6 new sites were sampled. Thus, the 2004 database contains data for 122 sampling events at 50 unique sites. Table 2 summarizes sites and sampling years.

Metric scoring criteria were re-developed each year as new data was added. For 2004, all 122 records were utilized. Ranges of individual metrics, as well as median metric values remained remarkably consistent in each of the 4 years; minimal changes resulted from the addition of new data in 2004. The summary metric values and scores for the 2004 samples are given in Tables 3a-3d.

Table 1. Aquatic invertebrate metrics employed in the MTDT mitigation wetland monitoring study, 2001- 2004.

Metric	Metric Calculation	Expected Response to Degradation or Impairment
Total taxa	Count of unique taxa identified to lowest recommended taxonomic level	Decrease
POET	Count unique Plecoptera, Trichoptera, Ephemeroptera, and Odonata taxa identified to lowest recommended taxonomic level	Decrease
Chironomidae taxa	Count unique midge taxa identified to lowest recommended taxonomic level	Decrease
Crustacea taxa + Mollusca taxa	Count unique Crustacea taxa and Mollusca taxa identified to lowest recommended taxonomic level	Decrease
% Chironomidae	Percent abundance of midges in the subsample	Increase
Orthocladiinae/Chironomidae	Number of individual midges in the sub-family Orthocladiinae / total number of midges in the subsample.	Decrease
%Amphipoda	Percent abundance of amphipods in the subsample	Increase
%Crustacea + %Mollusca	Percent abundance of crustaceans in the subsample plus percent abundance of molluscs in the subsample	Increase
HBI	Relative abundance of each taxon multiplied times that taxon's modified Hilsenhoff Biotic Index value. These numbers are summed over all taxa in the subsample.	Increase
%Dominant taxon	Percent abundance of the most abundant taxon in the subsample	Increase
%Collector-Gatherers	Percent abundance of organisms in the collector-gatherer functional group	Decrease
%Filterers	Percent abundance of organisms in the filterer functional group	Increase
