1.0 INTRODUCTION

The US Highway 93 Onsite Wetland Mitigation Sites were developed to mitigate wetland impacts associated with eight Montana Department of Transportation (MDT) segments of the US 93 Evaro to Polson highway reconstruction project along US Highway 93. This 2009 report documents: i) the third year of monitoring at the Bouchard and Jocko Spring Creek properties; ii) the second year of monitoring at the Peterson property; and, iii) the first year of monitoring at the new Mission Creek and Mud Creek sites.

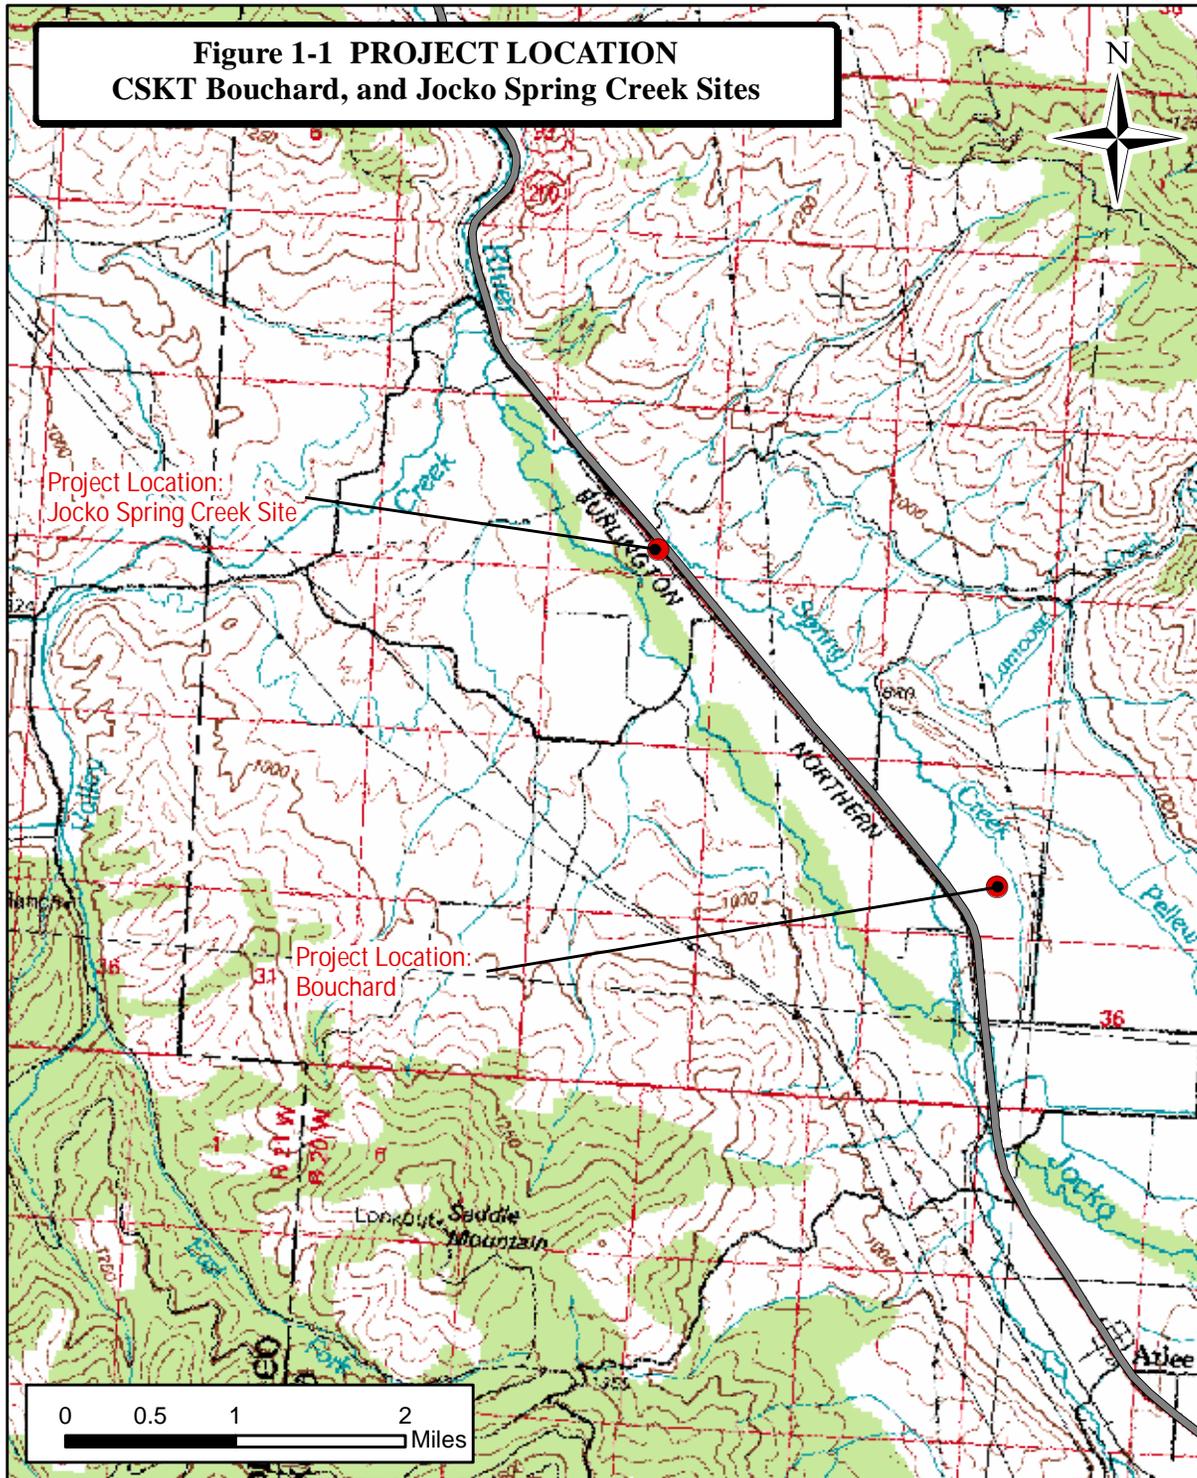

The US Highway 93 Onsite Wetland Mitigation Sites are all located in Lake County in Watershed # 3 (Lower Clark Fork). The five mitigation sites are located north of Arlee, Montana between Mileposts 20 and 50. The Bouchard and Jocko Spring Creek sites are located between Mileposts 20 and 25, along a segment identified as Project 4 - White Coyote Road-South of Ravalli (**Figure 1-1**). The Mission Creek site is located south of St. Ignatius near Milepost 32, along the segment identified as Project 6 – Medicine Tree (Old US 93)-vicinity Red Horn Road (**Figure 1-2**). The Peterson site is located north of St. Ignatius near Milepost 35, also along the segment identified as Project 6. The Mud Creek Site is located south of Pablo near Milepost 50, along a segment identified as Project 7 – Spring Creek Road to Minesinger Trail (**Figure 1-3**)

1.1 Impacts and Mitigation

Wetland impacts for the US 93 Evaro to Polson Highway reconstruction project were identified in a wetland mitigation plan prepared by Herrera Environmental Consultants (Herrera 2004). The impact totals for this report are based on information in the 2004 mitigation plan and 2007 monitoring report (Herrera 2007) and further clarification with MDT (Basting pers. comm.). The 2004 wetland mitigation plan provides wetland mitigation concepts, identifies the wetland community types targeted for establishment, and calculates the wetland mitigation credits expected to be obtained from each site. The mitigation plan specified total acres of impacts predicted for project segments 4, 6, and 7. These acres are separated into impact totals based on the Confederated Salish and Kootenai Tribes (CSKT) and the Army Corps of Engineers (Corps) regulated wetlands. Mitigation crediting systems also vary between these two agencies and are described in more detail in following sections.

Approximately 22.01 acres of impacts were calculated for the CSKT and 19.63 acres for the Corps regulated wetlands. **Table 1** shows the acreage of wetlands impacted within the three project segments. **Table 2** shows the expected mitigation credits for each project segment, wetland mitigation site, mitigation types, and expected wetland mitigation credits for both the CSKT and Corps. These expected credits are discussed in more detail in the results section for each mitigation site. Following 2008 monitoring, the Jocko River Bridge site was removed from scheduled subsequent monitoring activities and two new sites were added: Mission Creek and Mud Creek.

¹ Onsite Wetland Mitigation Plan, US 93 Evaro to Polson (Herrera 2004).

² MDT Wetland Mitigation Monitoring Report: Year 2007 (Herrera 2007).

³ Personal communication with MDT (Basting 2008).

⁴ Corrected from values presented in the 2007 US 93 mitigation monitoring report; revised figures are based on the site plan.

The CSKT crediting approach is based on the *CKST Wetlands Conservation Plan (1999)*. The CSKT crediting approach determines the final acres of credit based on an equation that calculates a weighted ratio for restoration based on two variables: mitigation types and impacted wetland classes. The CSKT uses the following mitigation types to determine ratios: preservation, restoration (primary or secondary), enhancement, and creation. The varying mitigation types have a range of ratios that are applied when calculating the final crediting ratios. **Table 3** lists the credit ratios per targeted mitigation type developed by CSKT for the highway reconstruction project. Refer to **Appendix H – CSKT Mitigation Ratios from Wetland Conservation Plan** (Parker 2002) for specific details on how the ratios are calculated.

Table 3: Mitigation credit ratio for CSKT per targeted mitigation types.

TARGETED MITIGATION TYPE	CREDIT RATIO ¹
Creation	3.36:1
Primary restoration	1.86:1
Secondary restoration	1.86:1

¹ From MDT Wetland Mitigation Monitoring Report: Year 2007 (Herrera 2007).

The Corps crediting approach for the US Hwy 93 Onsite project is based on a crediting system developed by Herrera Environmental Consultants and approved by the Corps (Herrera 2004). The Corps crediting approach includes the following mitigation types: creation, restoration (re-establishment and rehabilitation) and enhancement. The credit ratio for creation and restoration (re-establishment) activities is 1:1. The credit ratio for restoration (rehabilitation) and enhancement is based on the measured and projected shift in wetland functions and values resulting from wetland mitigation activities. Wetland compensatory mitigation ratios specified by the Corps for rehabilitation and enhancement are based on use of the 1999 MDT Montana Wetland Assessment Method (Berglund 1999) which assigns a functional score. This mitigation concept uses baseline (pre-project) and post-project functional scores to evaluate functional lift. The ratio for rehabilitation and enhancement is calculated each year to determine an enhancement factor that is then applied to the total acres of the applicable mitigation type. The enhancement factor is part of the equation and is the inverse of the enhancement ratio. The following equation is used to determine the enhancement factor and ultimately the enhancement ratio:

$$\text{Enhancement factor} = [(F_{\text{post}} - F_{\text{pre}}) / F_{\text{pre}}]$$

where F_{post} = projected post-mitigation project functional score; and F_{pre} = pre-project functional score.

The following formula includes the enhancement factor in the equation and is used to calculate wetland mitigation credits expressed as acres (Herrera 2004).

$$A_{\text{credited}} = A_{\text{created}} + A_{\text{existing}} [(F_{\text{post}} - F_{\text{pre}}) / F_{\text{pre}}]$$

where A_{credited} = wetland mitigation credits expressed as acres; A_{created} = wetland creation acres; A_{existing} = existing wetland acres to be enhanced; F_{post} = projected post-mitigation project functional score; and F_{pre} = pre-project functional score.

Mitigation crediting systems and current credits are discussed for each individual mitigation site under each **Current Credit Summary** section. The above-mentioned equation is applied to mitigation sites that include rehabilitation and enhancement activities to determine the current credit ratio and the associated credit acres.

1.2 Mitigation Sites

The US Highway 93 Onsite project includes five wetland mitigation sites located on the Flathead Indian Reservation and managed by the CSKT (**Figures 1-1, 1-2, and 1-3**). The following

sections provide a general discussion of each wetland mitigation site including location, site topography, mitigation objectives, and targeted wetland community goals.

The sites were designed to mitigate for specific wetland functions impacted by MDT roadway projects, such as, storm water retention, roadway runoff filtration, sediment and nutrient retention, water quality, groundwater recharge, wildlife habitat, and riparian vegetation.

1.2.1 Bouchard Property

The Bouchard Property mitigation site is a 40-acre parcel located in the Project 4 segment and is adjacent to US 93 at approximately Milepost 20.5. The Bouchard Property is located in Section 26 of Township 17N and Range 20W. The site occurs east of US Highway 93, between the highway and Spring Creek. Spring Creek runs along the east side of the parcel boundary and historically provided a major source of surface water to the Bouchard property. The parcel previously included an abandoned home site, fish rearing ponds, and a system of drainage ditches and berms used to control water flow on the property. The site is near the headwaters of Jocko Spring Creek and contains a high water table that inundates a large portion of the site. Elevation is approximately 2,960 feet with slight topographic variation throughout the project site. The monitoring area boundary is illustrated on **Figure 2: Bouchard (Appendix A)**. Mitigation plan sheets are presented in **Appendix D**.

The proposed mitigation actions included the following:

- Plug drainage ditches and remove berms adjacent to the existing fish ponds;
- Excavate topography in the southeast corner of the property to lower elevation to that of adjacent wetlands; and
- Create forested, scrub-shrub and emergent wetland vegetation types with installation of native plant species in the excavated cells.

The targeted wetland community types included forested and scrub-shrub, dominated by a smaller cover area of quaking aspen (*Populus tremuloides*) / red osier dogwood (*Cornus stolonifera*) habitat, and larger coverage of Bebb's willow (*Salix bebbiana*) and bog birch (*Betula glandulosa*) / beaked sedge (*Carex utriculata*) communities. Initial construction was completed in summer 2006, and revegetation with herbaceous plants and shrubs was completed in August-October 2006.

1.2.2 Jocko Spring Creek

The 6.5-acre Jocko Spring Creek mitigation site is located along the south side of the Montana Rail Link (MRL) grade just north of the Jocko Spring Creek highway crossing. The site occurs at approximately Milepost 23 in Section 16 of Township 17N and Range 20W. Jocko Spring Creek flows under the highway and the MRL bridge in a newly constructed channel, and then flows northwest parallel to the railroad grade before it connects to the existing channel alignment on the northwest end of the project area. The mitigation site encompasses the new channel and its floodplain. Existing flows from Jocko Spring Creek provide water for the wetland mitigation site. Elevation is approximately 3,000 feet with slight topographic variation throughout the

small project site. The monitoring area boundary is illustrated on the **Figure 2: Jocko Spring Creek (Appendix A)**. Site plans are included in **Appendix D**.

The objectives included the following:

- Relocating Jocko Spring Creek from between the railroad and highway to a newly constructed channel west of the railroad;
- Constructing a new culvert under the railroad and in-line with the new highway bridge;
- Applying soft bioengineering treatments and installing near-bank plant material along in the new channel;
- Filling the abandoned Jocko Spring Creek channel with cobbles and gravel, topping with salvaged wetland soil, and planting;
- Creating scrub-shrub and emergent vegetation types with native wetland shrub and grass-like plantings and broadcast seeding of a wetland mix;
- Salvaging sod from the excavated channel placing along stream banks;
- Excluding grazing from the property; and
- Eliminating the existing vehicle pullout along the US Hwy 93.

The target wetland community is a palustrine scrub-shrub system supporting Bebb's willow with inclusions of emergent habitat. Initial construction of the new channel and floodplain was completed in March 2006 with prevegetated coir mats installed during April 2006. Revegetation efforts, including shrub and herbaceous plantings, were completed during August to October 2006.

1.2.3 Mission Creek

The 0.22-acre Mission Creek mitigation site occurs in the Project 6 segment just south of St. Ignatius adjacent to the highway. The site is located between Milepost 32 and 33 in Section 14 of Township 18N and Range 20W. The Mission Creek site consists of Mission Creek and adjacent floodplains along the drainage. Site hydrology is provided by perennial Mission Creek. The monitoring area boundary is illustrated on **Figure 2: Mission Creek (Appendix A)**. Site plans are included in **Appendix D**.

The “wetland mitigation” proposal for this site involved several items under the general category of floodplain “system” re-establishment (as opposed to wetland re-establishment). This included removing the culvert and roadway fill, restoring the stream channel, and expanding the floodplain underneath the new bridge. The intent was to: i) line the stream channel with stream aggregates and install class 1 riprap and boulder clusters along the channel under the bridge; ii) use class 1 riprap, boulder clusters, and embedded brush layers in the portions of the stream channel extending upstream and downstream from the drip line of the bridge; iii) to re-establish a small floodplain underneath the bridge; iv) plant native vegetation along the floodplain both upstream and downstream of the bridge and to extend the vegetation approximately 6.6 feet under the bridge with compacted subgrade above the ordinary high water mark to allow wildlife passage; v) place gravels below the ordinary high water mark to line the newly opened channel; vi) install 50 individual brush pieces along the stream channel at about the ordinary high water mark from approximately 6.6 feet underneath the bridge extending both upstream and

downstream on both sides of the channel; and iv) remove fill on the southwest side of the new bridge abutment and revegetate the area.

Restoration of the channel and floodplain was completed in summer 2007. Revegetation efforts were completed during summer of 2008 and included riparian tree, shrub, and herbaceous plantings.

1.2.4 Mud Creek

The 2.54-acre Mud Creek mitigation site occurs in the Project 7 segment just south of Pablo. The site is located near Milepost 50 in Section 13 of Township 21N and Range 20W. The mitigation site consists of Mud Creek and adjacent wetlands dominated by emergent vegetation and remnant stands of hawthorn shrubs. Site hydrology is sourced by perennial Mud Creek that flows from the east under the newly constructed bridges along Highway 93 and through the southeast corner of the site. The monitoring area boundary is illustrated on **Figure 2: Mud Creek (Appendix A)**. Site plans are included in **Appendix D**.

The mitigation objectives for both wetland rehabilitation and creation included the following:

- Fencing the mitigation site to prevent cattle grazing;
- Controlling invasive weedy species such as reed canarygrass;
- Performing wetland mitigation planting to increase diversity of wetland plants;
- Constructing and realigning the Mud Creek channel to provide higher surface water elevation allowing for recharge of adjacent wetlands; and
- Grading and revegetating the abandoned portion of Mud Creek located within the proposed US Highway 93 median.

The targeted wetland community is a palustrine forested and scrub-shrub system supporting black cottonwood (*Populus trichocarpa*), thin-leaf alder (*Alnus incana*), and Bebb's willow with inclusions of emergent wetland habitat. Initial construction of the new channel and floodplain was completed in summer 2007 with the installation of prevegetated coir mats along the channel. Revegetation efforts, including tree, shrub and herbaceous plantings, were completed during the late summer of 2008.

1.2.5 Peterson

The 30-acre Peterson mitigation site occurs in the Project 6 segment approximately 3 miles north of St. Ignatius and west of the highway. The site is located south of Milepost 36 in Section 2 of Township 16N and Range 20W. The Peterson site consists of a wetland draw dominated by herbaceous vegetation. Site hydrology is sourced by an unnamed perennial tributary to Post Creek. The monitoring area boundary is illustrated on **Figure 2: Peterson (Appendix A)**. Site plans are included in **Appendix D**.

The objectives included the following:

- Constructing impoundments using twelve log crib structures and earthen berms;
- Excavating an oxbow basin along the outer fringe of existing wetland boundaries; and

- Planting shrubs and herbaceous plugs within the oxbow basin, wetland fringe, and log crib structures.

The targeted wetland community type at this site is a scrub-shrub / emergent vegetation type, supporting thinleaf alder (*Alnus incana*)/ red osier dogwood (*Cornus stolonifera*) and Nebraska sedge (*Carex nebrascensis*) / Baltic rush (*Juncus balticus*) habitat types. Revegetation work was completed in October 2006.

2.0 METHODS

2.1 Monitoring Dates and Activities

A spring kick-off visit was conducted on May 28th to review the Mission and Mud Creek sites with MDT and CSKT personnel. Monitoring activities at the four sites were conducted between July 22nd and August 16th of 2009 (mid-season). Specifically, the mitigation sites were visited as follows: Bouchard – July 22nd; Jocko Spring Creek - July 31st; Mission Creek - July 23rd, Mud Creek - July 23rd, and Peterson - August 16th. The mid-season visits were conducted to document vegetation, soil, and hydrologic conditions used to map jurisdictional wetlands. All information contained on the Wetland Mitigation Site Monitoring Form for all five sites (**Appendix B**) was collected at this time. Activities and information conducted or collected included: wetland delineation; wetland/open water aquatic habitat boundary mapping; vegetation community mapping; vegetation transect monitoring; soils data collection; hydrology data collection; bird and general wildlife use documentation; photography; macroinvertebrate sampling (Jocko Spring Creek site only); mapping using a global positioning system (GPS) unit; functional assessment; and (a non-engineering) examination of topographic features.

2.2 Hydrology

Wetland hydrology indicators were recorded during the mid-season visit using procedures outlined in the COE 1987 Wetland Delineation Manual (Environmental Laboratory 1987). Hydrology data were recorded on COE Routine Wetland Delineation Data Forms (**Appendix B**). Additional hydrologic data were recorded on the Wetland Mitigation Site Monitoring Form (**Appendix B**). No groundwater monitoring wells were installed at any of the five wetland mitigation sites. Western Regional Climate Center (WRCC) data obtained from the closest weather station to each project was used to as an indicator of current and historical precipitation patterns at each project site.

2.3 Vegetation

General dominant species-based vegetation community types were delineated onto the 2009 aerial photographs. Standardized community mapping was not used because many of these systems are geared towards climax vegetation and do not reflect annual changes.

In association with MDT and CSKT, new ten-foot wide belt transects were established at all sites during the 2008 and 2009 reconnaissance visits for Bouchard, Jocko Spring Creek, Mud, and Peterson sites. Transects were not placed at the Mission Site. The new transects replaced any

previously-located transects to better represent and capture future vegetative changes at each of the sites. These were sampled during the mid-season visit to represent the range of current vegetation conditions. Percent cover was estimated for each plant species found within each community type as follows: + (< 1 %); 1 (1-5%), 2 (6-10%); 3 (11-20%); 4 (21-50%); and 5 (>50%). The category of percent cover for dominant plants in each community type was listed on the Wetland Mitigation Site Monitoring Form (**Appendix B**).

The transect locations were marked on the aerial photographs and with a GPS unit. A photograph was taken of the transect from each start and end location.

A comprehensive plant species list has been maintained for each site. All noxious weed locations were mapped. Survival of each planted woody species was estimated.

2.4 Soils

Soils were evaluated during the mid-season site visit using the hydric soils determination procedures outlined in the COE 1987 Wetland Delineation Manual (Environmental Laboratory 1987). Soil data were recorded for each wetland determination point on the COE Routine Wetland Delineation Data Forms (**Appendix B**).

2.5 Wetland Delineation

Wetland delineations were conducted during the mid-season visits in accordance with the 1987 COE Wetland Delineation Manual. In July 2008, consultation with the COE (Steinle pers. comm.) confirmed that, where the 1987 manual was used to establish baseline wetland conditions at MDT wetland mitigation sites, it should continue to be applied at such sites for the duration of the monitoring period. Consequently, application of the new *Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region* (COE 2008) was not required or undertaken at any of the five sites in 2009.

Wetland and upland areas within the monitoring areas were investigated for the presence of wetland hydrology, hydrophytic vegetation, and hydric soils. The indicator status of vegetation was derived from the *National List of Plant Species that Occur in Wetlands: Northwest Region 9* (Reed 1988). Information was recorded onto COE Routine Wetland Delineation Data Forms (**Appendix B**). The wetland/upland boundaries were located with a resource-grade GPS unit and by hand mapping onto each aerial photograph. The wetland/upland boundaries in combination with the wetland/open water boundaries were used to calculate the final wetland acreage.

2.6 Fish and Wildlife

Fish, mammal, reptile, and amphibian species observations and indicators of their use (i.e., vocalizations, tracks, scat, burrows, eggshells, and bones) were recorded onto the Wetland Mitigation Site Monitoring Form during each mid-season visit (**Appendix B**). Observations were recorded while conducting other required activities. Direct sampling methods, such as snap traps, live traps, and pitfall traps, were not used.

2.7 Birds

Bird observations were recorded during each mid-season visit according to the Bird Survey Protocol (**Appendix E**). No formal census plots, spot mapping, point counts, or strip transects were conducted. Bird observations were recorded incidental to other required monitoring activities, but were categorized by species, activity code, general habitat and recorded onto the Bird Survey Field Data Sheet (**Appendix B**).

2.8 Macroinvertebrates

Macroinvertebrate samples were only collected at the Jocko Spring Creek during the mid-season site visit. Collection occurred using the Macroinvertebrate Sampling Protocol (**Appendix F**). Samples were preserved as outlined in the sampling procedure and sent to Rhithron Associates, Inc. in Missoula, Montana for analysis. The macroinvertebrate sampling location was mapped with a GPS unit.

2.9 Functional Assessment

Pre-project functional assessments of all five sites used the 1999 MDT Montana Wetland Assessment Methodn (MWAM). In 2009, application of the 1999 method was continued at all five sites. The 2008 MDT MWAM version has not been used at these sites because the crediting requirement compares the functional shift between the pre- and post-project functional assessments (**Appendix B**). Field data necessary for these assessments were collected during the mid-season visits.

2.10 Photographs

The July 1, 2009 aerial photographs of each of the five sites were used for **Figures 2 and 3** (**Appendix A**). On-the-ground photographs were taken to illustrate the current land uses surrounding each site, the upland buffer, the monitored area, and the vegetation transects (**Appendix C**). Each photograph point location was mapped using a resource grade GPS unit. All photographs were taken using a digital camera.

2.11 GPS Data

During the 2009 monitoring season, point data were collected with a resource-grade GPS unit at the vegetation transect start and end locations and at all photograph locations. Wetland boundaries were recorded with a resource-grade GPS unit in 2009 (along with hand mapping onto the aerial photographs). Procedures used for GPS mapping and aerial photography referencing are included in **Appendix E**.

2.12 Maintenance Needs

Observations were made of existing structures and of erosion/sediment problems to identify maintenance needs. This did not constitute an engineering-level structural inspection, but rather a cursory examination. Current or future potential problems were documented on the monitoring forms.

3.0 RESULTS

3.1 Bouchard Property

3.1.1 Hydrology

The main source of hydrology is seasonal inundation from a high groundwater table associated with adjacent perennial Spring Creek. Spring Creek irrigation surface water previously entered the site through a series of ditches and berms. Several historic fish rearing ponds are located onsite that were previously filled with surface water from Spring Creek and were mapped as open water. Mitigation objectives included plugging and filling the ditches, and removing berms and other water-controlling features. A secondary source of hydrology is the persistent upwelling and lateral movement of groundwater through the alluvial materials across the valley floor sourced by local irrigation practices and hydrology associated with the Jocko River.

Shallow open-water areas occurred across approximately 0.39 acre or 1 % of the wetland area during the mid-season visit (**Figure 3 in Appendix A**). Water depth in these areas was approximately 4.0 feet. Inundation from discharging groundwater was observed at this time across another 15% of the wetland area. Inundation was present within Community Types 2, 3, 5, and 7 (**Bouchard Figure 3 in Appendix B**).

According to the Western Regional Climate Center (WRCC), mean monthly precipitation from January through July from 1896 to 2009 totaled 15.83 inches at the St Ignatius weather station (WRCC 2009). During 2009, 8.77 inches (55% of the mean) of precipitation were recorded at this station between January and July (WRCC 2009).

3.1.2 Vegetation

Eighty-one plant species were identified at the site since 2007 (**Table 4**). The majority of these species are herbaceous. The site contains a few small stands of black cottonwood (*Populus trichocarpa*) and aspen (*Populus tremuloides*) trees near or adjacent to the ponds. Eight wetland and one upland community types were identified and mapped at the mitigation site (**Bouchard Figure 3 in Appendix A**). The eight wetland community types were Type 2: *Deschampsia/Juncus*, Type 3: *Juncus/Eleocharis*, Type 4: *Juncus/Cirsium*, Type 5: *Carex*, Type 6: *Betula/Potentilla*, Type 7: *Alnus/Glyceria*, Type 8: *Populus*, and Type 9: *Typha*. The eight wetland communities occur within wetland creation, rehabilitation, and re-establishment areas. Plant species observed within each of these communities are listed on the **Monitoring Form (Appendix B)**.

The upland community type was Type 1: *Agropyron/Agrostis*. Plant species observed within this community are also listed on the **Monitoring Form (Appendix B)**.

Table 4: 2007 to 2009 vegetation species list for the Bouchard Wetland Mitigation Site.

Scientific Name ¹	Common Name	Region 9 (Northwest) Wetland Indicator
<i>Achillea millefolium</i>	common yarrow	FACU
<i>Agrostis alba</i>	redtop	FAC+
<i>Agropyron repens</i>	quackgrass	FACU
<i>Agropyron trachycaulum</i>	slender wheatgrass	FAC
<i>Alnus incana</i>	alder	FACW
<i>Alopecurus pratensis</i>	meadow foxtail	FACW
<i>Alyssum alyssoides</i>	alyssum	--

<i>Vicia</i> spp.	vetch	--

¹ **Bolded** species were documented in the analysis area for the first time in 2009.

Community types 2 and 3 and the pond areas were the wettest sites. These were located in the southeast corner of the property within the wetland creation area, and were dominated by emergent vegetation and aquatic bed habitat (**Bouchard Figure 3 in Appendix A**). The wetland creation area was planted and seeded with yarrow (*Achillea millefolium*), tufted hairgrass (*Deschampsia cespitosa*), slender wheatgrass (*Agropyron trachycaulon*), and fowl bluegrass (*Poa palustris*). Type 2 was dominated by tufted hairgrass, redtop (*Agrostis alba*), and slender rush (*Juncus tenuis*). Type 3 was located within the wetland creation area and was dominated by several species, including, dagger rush (*Juncus ensifolius*), slender rush, redtop, and spike-rush (*Eleocharis* spp.). Several small patches of cattail (*Typha latifolia*) existed within the boundaries of Type 2 and 3, but were not mapped as a separate community type.

Native containerized shrubs and herbaceous plugs were planted during the spring of 2006. Planted shrubs are arranged in patches within the created wetland to mimic natural distribution of native scrub-shrub species.

Community Types 4, 5, and 9 are dominated by mostly emergent vegetation types and occurred in the wetland rehabilitation areas. Type 4 is an existing emergent wetland that consists of

mostly wetland species, but has a small inclusion of weedy and / or aggressive species. The wetter species within Type 4 included Baltic rush, redtop, and big-leaf avens (*Geum macrophyllum*). Type 4 contained two noxious weed species: Canada thistle (*Cirsium arvense*) and hound's-tongue (*Cynoglossum officinale*). Type 5 also occurred within the wetland rehabilitation area and was dominated by herbaceous wetland species including beaked sedge, fox sedge (*Carex vesicaria*), Baltic rush, fowl mannagrass (*Glyceria striata*), and woolly sedge (*Carex lanuginosa*). Type 9 occurred in the wettest area and was dominated by a monoculture of cattail.

Community types 6, 7, and 8 are scrub-shrub and forested types located in the wetland rehabilitation area. Type 6 was a scrub-shrub community dominated by water birch (*Betula occidentalis*) and shrubby potentilla (*Potentilla fruticosa*) with a mixture of herbaceous species similar to Type 5. Type 6 occupied the second largest area of all the community types in the mitigation area. Type 7 was a scrub-shrub vegetation type dominated by thinleaf alder (*Alnus incana*) and containing an herbaceous layer dominated by fowl mannagrass. Type 8 was a forested vegetation type dominated by black cottonwood and quaking aspen. Black cottonwood and some quaking aspen dominate the areas surrounding the several existing ponds or shallow open waters. Type 8 areas were also found on the east side of the property along Spring Creek.

Adjacent upland vegetation communities were dominated by pasture grasses and/or aggressive invasive species. Type 1 upland areas were dominated by slender wheatgrass, yarrow, quackgrass (*Agropyron repens*), Canada thistle, and hound's-tongue.

Several noxious weeds were observed at the Bouchard property. Community types 1, 3, and 4 contained Canada thistle, hound's-tongue, and St. John's wort (*Hypericum perforatum*). The majority of the weed species were found on the west side of the parcel along the upland and wetland fringe between Types 1 and 5. Canada thistle was the most abundant weed species and had a moderate to high coverage value. Hounds tongue and St. John's wort were recorded at low to moderate levels. Two other noxious weeds, oxeye daisy (*Chrysanthemum leucanthemum*) and spotted knapweed (*Centaurea maculosa*), were recorded at low levels. Noxious weed locations in 2009 were mapped (**Bouchard Figure 3 in Appendix A**).

Vegetation transect results were detailed in the **Monitoring Form (Appendix B)** and were summarized in tabular format in **Tables 5, 6, and 7**, and graphically illustrated in **Charts 1 - 6**. The 2007 transect location was changed in 2008; therefore, no 2007 transect data are presented.

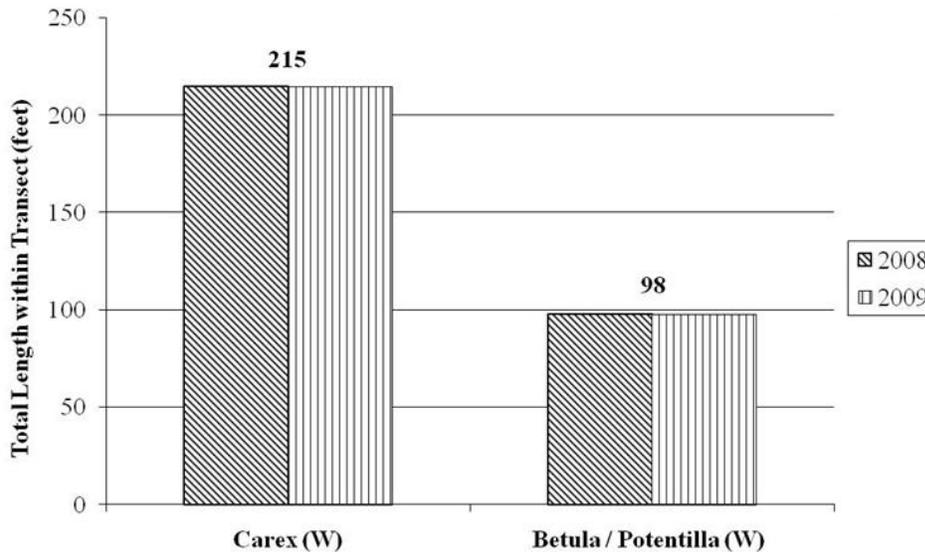

Chart 5: Bouchard Property - Transect 3 map showing vegetation types from the start (0 feet) to the end (133 feet) for each year monitored.

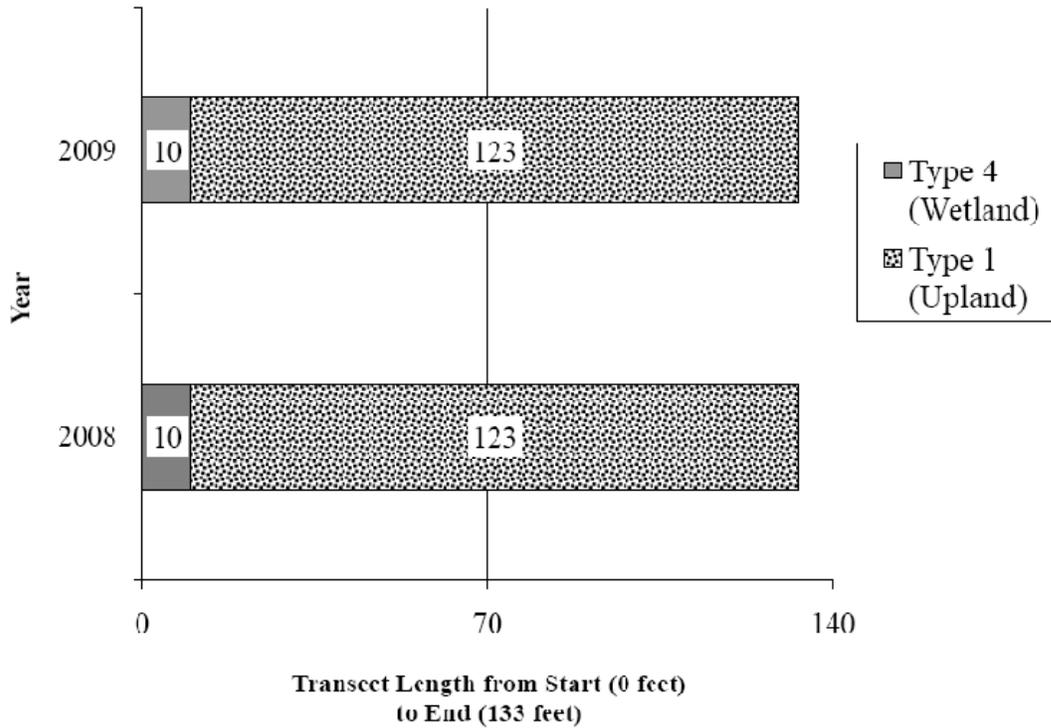

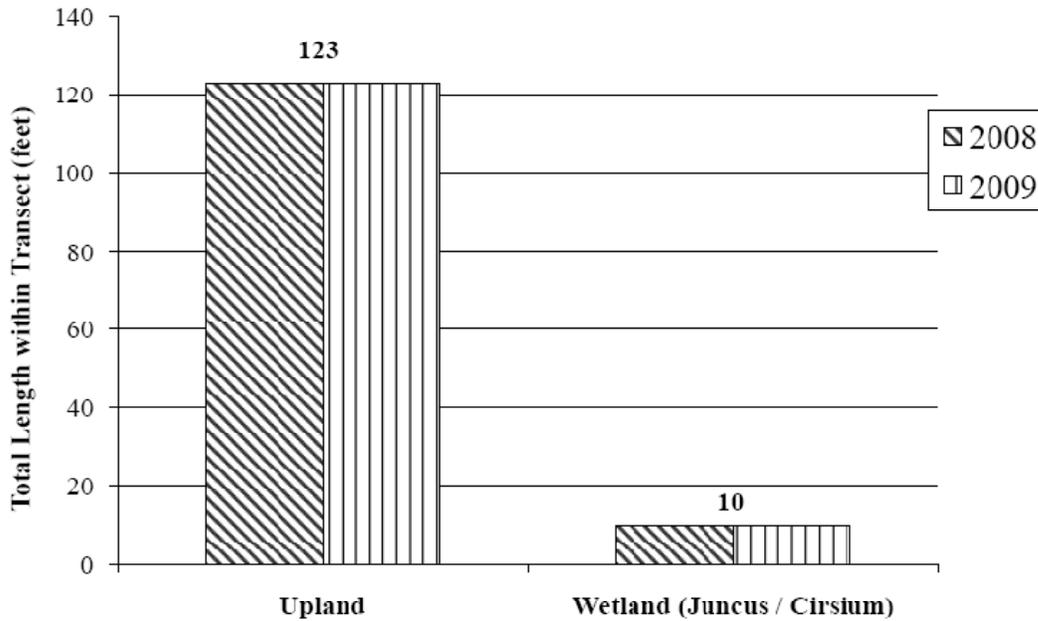

Chart 6: Bouchard Property - length of vegetation communities within Transect 3 from 2008 to 2009.

3.1.3 Soils

The five soils types mapped at the Bouchard property in the Lake County Soil Survey (NRCS 2009) are:

- Borohemists, 0 to 1 percent slope
- Colake silt loam, 0 to 1 percent slope
- Colake silt loam, drained, 0 to 1 percent slope
- Jocko gravelly loam, 0 to 4 percent slope
- Lamoose loam, 0 to 2 percent slope

Four of the five soils types mapped at the Bouchard property were listed as hydric soils (NRCS 2008). These were Borohemists, Colake silt loams, and Lamoose loam. Borohemists are very poorly drained and occur on low stream terraces and floodplains. The Colake silt loam series are poorly drained and occur in swales and depressions on till plains and low stream terraces. The Lamoose series are poorly drained and occur on floodplains. The Jocko series is well drained and occurs in a very small portion of the site (NRCS 2008). Soil characteristics at each wetland determination point were compared with those of the mapped soils. The soils observed across most of the site generally matched the soil descriptions.

Wetland soils observed during monitoring and documented on the Routine Wetland Determination form were mostly loam or silt loam textured soils with very low chroma colors (1 or 2) throughout the soil profile. Redoximorphic features such as redox concentration (mottles) or depleted matrixes were not observed in any of three profiles.

3.1.4 Wetland Delineation

Wetlands were delineated and mapped (**Bouchard Figure 3 in Appendix A**). Soils, vegetation, and hydrology are documented on the **COE Forms (Appendix B)**. Approximately 28.53 gross wetland acres currently occur within the monitoring area (**Table 8; Bouchard Figure 3 in Appendix A**). The site contains 28.14 wetland acres and 0.39 acre of shallow open water (**Table 8**).

Table 8: Aquatic habitats and acreages at the Bouchard Wetland Mitigation Site.

CONDITION	2004 ¹ (acre)	2007 ² (acre)	2009 (acre)
Wetland Area	19.03	29.26	28.14
Open Water Area	---		0.39
Total Aquatic Habitat	19.03	29.26	28.53

¹Herrera 2004, ²Herrera 2007

Overall, the project has gained an estimated 9.50 wetland acres in comparison to 2004 baseline conditions. Prior to construction, the site contained approximately 19.03 acres of wetlands and shallow open water ponds within the current monitoring limits. The overall cumulative change in aquatic habitat at the site since construction has been approximately 28.53 - 19.03 = 9.5 acres.

Wetland size changed between the 2007 and 2008 monitoring, with a decrease of 0.73 acre. The 2007 and 2008 delineations were conducted by different firms. Slight variations in wetland mapping between the two firms most likely contributed to small differences in wetland acreages. Differences in wetland boundaries between the 2007 and 2008 wetland mapping were observed along the south side of the creation and restoration areas. During 2009 monitoring, the wetland sizes remained similar to those observed in 2008.

3.1.5 Fish and Wildlife

A comprehensive list of fish, mammals, reptiles, amphibians, and birds has been maintained for the Bouchard Property since 2007 (**Table 9**). In 2009 four mammal, one amphibian, and ten bird species were noted at the Bouchard mitigation site (**Table 9**). Specific evidence observed, as well as activity codes pertaining to birds, was recorded onto the **Monitoring Form** and **Bird Survey Form** in **Appendix B**.

Table 9: Fish and wildlife species observed at the Bouchard Mitigation Site from 2007 to 2009.

FISH	
None	
AMPHIBIAN	
Spotted Frog (<i>Rana luteiventris</i>)

None	
BIRD	
American Crow (<i>Corvus brachyrhynchos</i>) American Finch (<i>Carduelis tristis</i>) Black-Billed Magpie (<i>Pica hudsonia</i>) Black Capped Chickadee (<i>Parus atricapillus</i>) Brown-Headed cowbird (<i>Molothrus ater</i>) Common Flicker (<i>Colaptes auratus</i>) Cordilleran flycatcher (<i>Empidonax occidentalis</i>) Eastern Kingbird (<i>Tyrannus tyrannus</i>) Kill Deer (<i>Charadrius vociferus</i>) Mallard (<i>Anas platyrhynchos</i>) Marsh Wren (<i>Cistothorus palustris</i>)	Mourning Dove (<i>Zenaidura macroura</i>) Red-Winged blackbird (<i>Agelaius phoeniceus</i>) Red-tailed hawk (<i>Buteo jamaicensis</i>) Ring-necked Pheasant (<i>Phasianus colchicus</i>) Snipe (<i>Gallinago gallinago</i>) Song Sparrow (<i>Melospiza melodia</i>) Tree Swallow (<i>Tachycineta bicolor</i>) Wilson's Warbler (<i>Wilsonia pusilla</i>) Wood Duck (<i>Aix sponsa</i>) Yellow Warbler (<i>Dendroica petechia</i>)
MAMMAL	
Coyote (<i>Canis latrans</i>) Deer (<i>Odocoileus spp.</i>)	Meadow vole (<i>Microtus pennsylvanicus</i>) Muskrat (<i>Ondatra zibethicus</i>)

Bolded species were observed during the 2009 monitoring.

3.1.6 Macroinvertebrates

Macroinvertebrate sampling was not conducted at the Bouchard Property.

3.1.7 Functional Assessment

The functional assessment of 2009 was compared with the baseline conditions of 2004 (**Table 10**). The completed 2009 functional assessment is included in **Appendix B**. The Bouchard Property site was assessed as one assessment area (AA-1) and rated as a Category II site in 2009. Approximately 177 functional units occur at the Bouchard Property mitigation site (**Table 10**).

Table 10: Summary of baseline and 2009 wetland function/value ratings and functional points at the Bouchard Wetland Mitigation Project.

Function and Value Parameters from the MDT Montana Wetland Assessment Method	2004 Baseline (AA-1) ¹	2009 (AA-1) ¹
Listed/Proposed T&E Species Habitat	Low (0.3)	Low (0.3)

Net Acreage Gain (ac)	NA	9.5
Net Functional Unit Gain (fu)	NA	89.35

¹The baseline assessment was performed by Herrera Environmental Consultants and the 2009 assessment was completed by PBS&J; both assessments used the 1999 MDT MWAM.

3.1.8 Photographs

Representative photographs were taken in 2009 from established photo-points and transect ends (**Appendix C**).

3.1.9 Revegetation Efforts

Wetland and riparian vegetation enhancements were implemented during 2006. Wetland areas surrounding the excavated areas were broadcast seeded with a custom wetland seed mix and also planted with herbaceous and woody seedlings (**Appendix G**). Upland and wetland seed mixes were drill seeded at the different mitigation types or cells. The site was planted with native shrubs, grasses and grass-like seedlings.

Survival rates for native shrub plantings were assessed during the summer of 2009. The PBS&J botanist walked ten transects within the planting areas, visually assessed, counted, and recorded all live woody plantings by species (**Monitoring Form** in **Appendix B**). The original planting numbers as listed on the **Monitoring Form** (**Appendix B**) were referenced from the *Bouchard Wetland – Wetland Planting Summary* (**Appendix G**). Actual planting numbers and prescribed species may have varied from the original plan. Three species were found that were not listed in the original planting summary. Overall survival ratings are considered moderate to high based on visual assessment. Plant growth was vigorous and looked healthy with few discolored leaves. Browse protection was intact during the monitoring visit. In the fall MDT removed the browse control from the plantings so that the plants could thrive without this constricting netting. Planted species have reached a large enough size that they can withstand some browse from local wildlife.

3.1.10 Maintenance Needs/Recommendations

Several Category 1 noxious weeds were present (**Bouchard Figure 3** in **Appendix A**): Canada thistle, hound's-tongue, oxeye daisy, St. John's wort, and spotted knapweed. Noxious weeds should be controlled in accordance with the *Noxious Weed Management Guidelines, Species and Control Methods for US 93 Evaro to Polson Wetland Mitigation Sites* contained in the mitigation plan (Herrera 2004).

3.1.11 Current Credit Summary

As of 2009, approximately 28.53 aquatic habitat acres (28.14 acres of wetlands, 0.39 acre of shallow open water) occur on the mitigation site. Pre-project wetland delineation documented 19.03 acres of wetlands / open water. The initially-calculated net increase in aquatic habitat acres to date is approximately $28.53 - 19.03 = 9.50$ acres.

To determine the current crediting acres for the Bouchard Property, the total wetland acreage was separated into the individual mitigation type zones and the appropriate credit ratios applied for both the CSKT and Corps crediting systems. The Bouchard Property mitigation types are: creation, re-establishment (Corps) / primary restoration (CSKT), and rehabilitation (Corps) / secondary restoration (CSKT).

The following equation calculates the enhancement ratio for the rehabilitation activities based on functional assessment scores (**Table 10**):

$$\text{Enhancement factor} = [(F_{\text{post}} - F_{\text{pre}}) / F_{\text{pre}}]$$

where: F_{post} = projected post-mitigation project functional score; and F_{pre} = pre-project functional score.

$$\text{Enhancement factor} = [(6.2 - 4.6) / 4.6]; \text{ Enhancement factor} = 0.35$$

$$\text{Enhancement Ratio} = 1 / 0.35; \text{ Enhancement Ratio} = 2.86$$

Table 11 lists the current credits based on Corps and CSKT credit ratios, including this year’s calculated ratio for the rehabilitation areas at the Bouchard Property site. The Bouchard Property wetland mitigation site is progressing toward reaching the expected credits. The site currently provides slightly less than the expected creation credit acres, but is exceeding expectations in the remaining categories and as a whole, and is predicted to continue gaining in functional points and credit acreage as the wetlands continue to develop.

Table 11. Current credits at the Bouchard Property Wetland Mitigation Site.

Targeted Mitigation Type	Current Wetlands (Acre)	Credit Ratio		Current Credit (acre)		Expected Credit (acre)	
		CORPS	CSKT	CORPS	CSKT	CORPS	CSKT
Creation	4.79	1:1	3.36:1	4.79	1.43	5.16	1.54
Re-establishment / primary restoration	4.71 ¹	1:1	1.86:1	4.71	2.53	2.94	1.58
Rehabilitation / secondary restoration	19.03	2.86:1	1.86:1	6.65	10.23	4.05	10.23
Total	28.53			16.15	14.19	12.15	13.35

¹ Includes wetlands delineated outside of targeted creation, re-establishment, and rehabilitation areas and assumed to have been re-established by project implementation.

3.2 Jocko Spring Creek

3.2.1 Hydrology

The main source of hydrology for the site comes from the perennial Jocko Spring Creek. This mitigation site occurs along the newly constructed Jocko Spring Creek channel and floodplain. A secondary source of hydrology is the persistent upwelling and lateral movement of groundwater through the alluvial materials across the Jocko Valley. The site is located adjacent to a railroad line along the toe of the slope. The site may receive additional hydrology from discharging groundwater along that boundary. Inundation was observed across approximately 80% of the created and enhanced mitigation area wetlands adjacent to the channel.

According to the WRCC, mean monthly precipitation from January through July from 1896 to 2009 totaled 15.83 inches for the St Ignatius weather station (WRCC 2009). During 2009, 8.77 inches (55% of the mean) of precipitation were recorded at this station between January and July (WRCC 2009).

3.2.2 Vegetation

Fifty-eight plant species were identified at the site since 2008 (**Table 12**). The majority of these species are herbaceous. A few small remnant shrub patches exist, mostly along the southeast side of the project boundary. In addition, a small remnant stand of black cottonwood occurs within this area on the south side of railroad grade. A large peach-leaf willow occurs on the north side of the rail line along the old channel.

At the mitigation site five wetland and three upland communities were identified and mapped (**Jocko Spring Creek Figure 3** in **Appendix A**). The five wetland community types are Type 3: *Carex/Glyceria*, Type 4: *Typha*, Type 5: *Populus*, Type 6: *Juncus/Agrostis*, and Type 7: *Salix/Juncus*. The three upland community types are Type 1: *Agropyron*, Type 2: *Symphoricarpos*, and Type 8: *Salix*. Plant species observed within each of these communities are listed on the **Monitoring Form (Appendix B)**.

<i>Typha latifolia</i>	broad-leaf cattail	OBL
<i>Veronica Americana</i>	American speedwell	OBL
<i>Verbascum Thapsus</i>	common mullein	--

¹ **Bolded** species indicate those documented in the analysis area for the first time in 2009.

Types 3 and 4 are the wettest community types and occurred as emergent wetland communities with shallow inundation (**Jocko Spring Creek Figure 3 in Appendix A**). Type 3 was the most prevalent community type and was dominated by beaked sedge, Bebb's sedge, tall mannagrass, dagger rush, and reed canarygrass. Type 4 was dominated by cattail and had a minor amount of reed canarygrass.

Types 5, 6, and 7 were the next wettest areas, consisting of emergent and scrub-shrub vegetation types occurring in an undisturbed wetland and on the fringes of a newly constructed channel. Type 5 consisted of a small stand of forested vegetation dominated by black cottonwood with an understory of Bebb's willow and reed canarygrass. Type 6 was located adjacent to the channel and was dominated by Baltic rush and redtop. Type 7 was a remnant shrub patch dominated by an overstory of Bebb's willow and an understory of Baltic rush and redtop. Type 7 was similar to Type 6, except for the inclusion of shrub species.

Adjacent upland vegetation communities were dominated by pasture grasses, aggressive invasive plants, upland shrubs, and several large peach-leaf willows. Type 1 upland areas were currently dominated by slender wheatgrass, quackgrass, Kentucky bluegrass, Idaho fescue, cheatgrass and claspings pepper-grass. Type 2 upland areas were dominated by mostly common snowberry found in thick patches between the railroad grade and the highway, and other invasive species including Canada thistle, hound's-tongue, quackgrass and goldenrod. Type 8 was a small area dominated by several large peach-leaf willows along the north side of railroad grade located adjacent to the old Jocko Spring Creek channel.

Several noxious weeds were observed and mapped throughout the Jocko Spring Creek site (**Jocko Spring Creek Figure 3 in Appendix A**). Types 1 and 2 contained several patches of invasive species with a moderate cover class. These were individual noxious weed locations or small patches not mapped as a community type, and included Canada thistle and hound's-tongue.

Vegetation transect results are detailed in the **Monitoring Form (Appendix B)** and are summarized in tabular format (**Tables 13 and 14**), and are graphically illustrated (**Charts 7 to 10**). The 2007 transect location was changed in 2008; therefore, no 2007 transect data are presented.

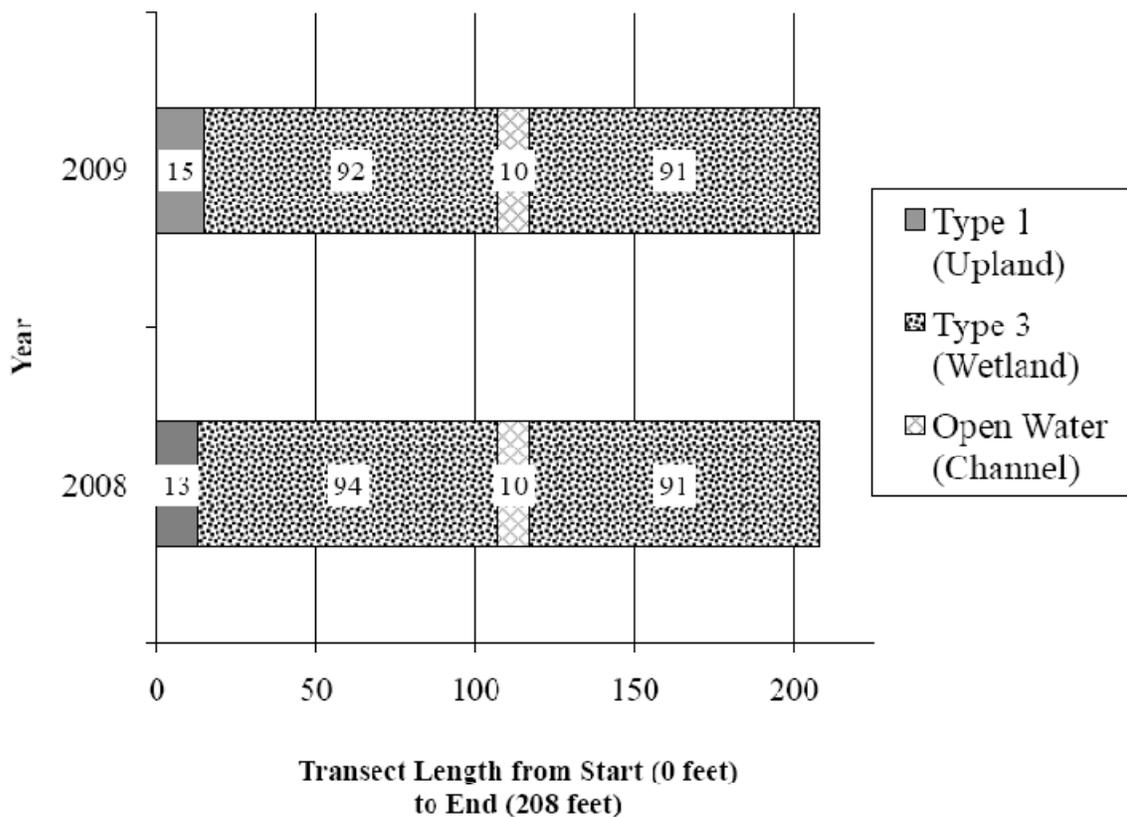

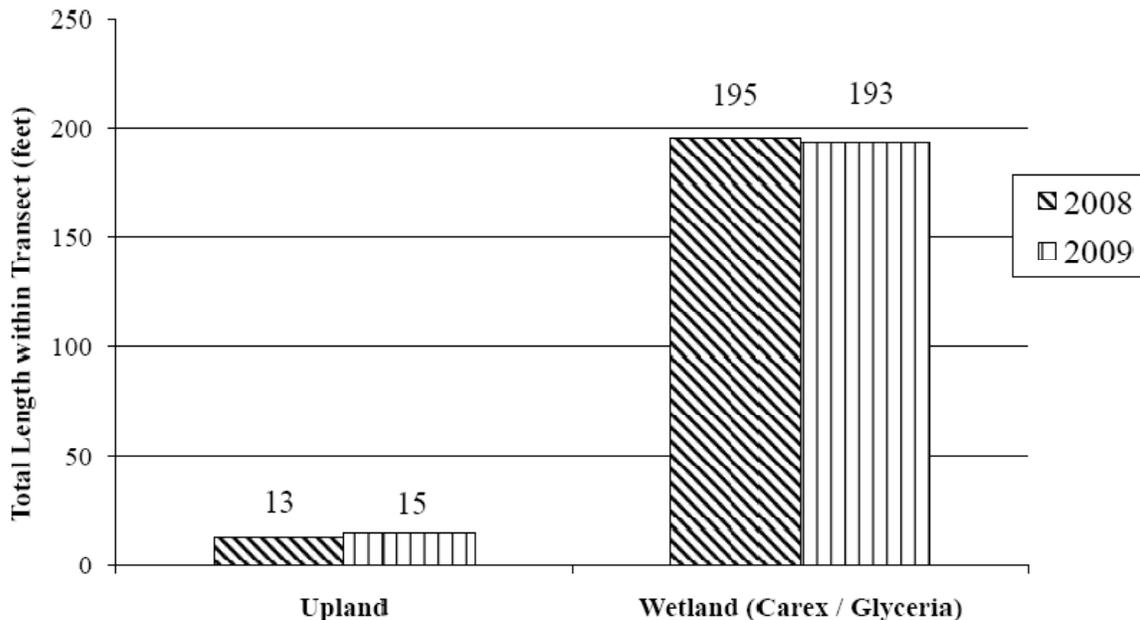

Chart 10: Jocko Spring Creek - length of vegetation communities within Transect 2 from 2008 to 2009.

3.2.3 Soils

Soils at the site were mapped in the Lake County Soil Survey as Jocko gravelly loam, 0 to 4 percent slope, Ninepipe silt loam, 0 to 2 percent slope, and Xerofluvents, 0 to 2 percent slope (NRCS 2009). The Jocko gravelly loam series are somewhat excessively drained soils and are located on stream terraces. The Ninepipe and Xerofluvents soil series are associated with low stream terraces, fans drainageways, and floodplains, and are moderately drained to somewhat poorly drained. Xerofluvents have two minor inclusions: Bohnly and Belton soils. Bohnly soils are considered hydric and are poorly drained (NRCS 2008).

Wetland soils observed during monitoring and documented on the Routine Wetland Determination form were mostly loams, or silt loams with very low chroma colors (1 or 2) within several inches of the surface (**Appendix B**). Redoximorphic feature such as redox concentrations or depleted matrix were not present in profiles.

3.2.4 Wetland Delineation

Wetland boundaries were delineated and mapped (**Jocko Spring Creek Figure 3 in Appendix A**). Approximately 2.08 aquatic habitat acres occurred within the monitoring area (**Table 15; Jocko Spring Creek Figure 3 in Appendix A**).

Table 15: Aquatic habitats and acreages at the Jocko Spring Creek Wetland Mitigation Site.

CONDITION	2007(acre) ²	2004 ¹ (acre)	2009 (acre)
Wetland Area	1.35	2.0	1.81
Open Water Area			0.27
Total Aquatic Habitat	1.35	2.0	2.08

¹Herrera 2004, ²Herrera 2007

Pre-project wetland delineation documented 2.0 acres of wetlands, which included the degraded Jocko Spring Creek channel and wetlands along the west side of the MRL line that were enhanced as part of the mitigation activities (Herrera 2004). The net increase in aquatic habitat acres to date on the site was approximately 2.08 – 2.0 = 0.08 acre.

Wetland size increased between the 2007 and 2008 monitoring by 0.90 acre. Wetland mapping captured new wetland areas along the southeast boundary during the 2008 monitoring that were not mapped during 2007, possibly due to wetland development associated with continued surface and groundwater flows across the site. During the 2009 monitoring the wetland areas were observed to be similar in size as those mapped in 2008. Approximately 1.81 wetland acres and 0.27 open water acre (consisting of the creek) occurred within the monitoring area (**Jocko Spring Creek Figure 3 in Appendix A**).

3.2.5 Fish and Wildlife

A comprehensive list of fish, mammals, reptiles, amphibians, and birds using the Jocko Spring Creek Site has been maintained since 2007 (**Table 16**). In 2009 three mammal and four bird species were noted at the mitigation site (**Table 16**). Specific evidence observed, as well as activity codes pertaining to birds, was recorded onto the **Monitoring Form** and **Bird Survey Form** in **Appendix B**.

² Observed by MDT.

Bolded species were observed during the 2009 monitoring.

3.2.6 Macroinvertebrates

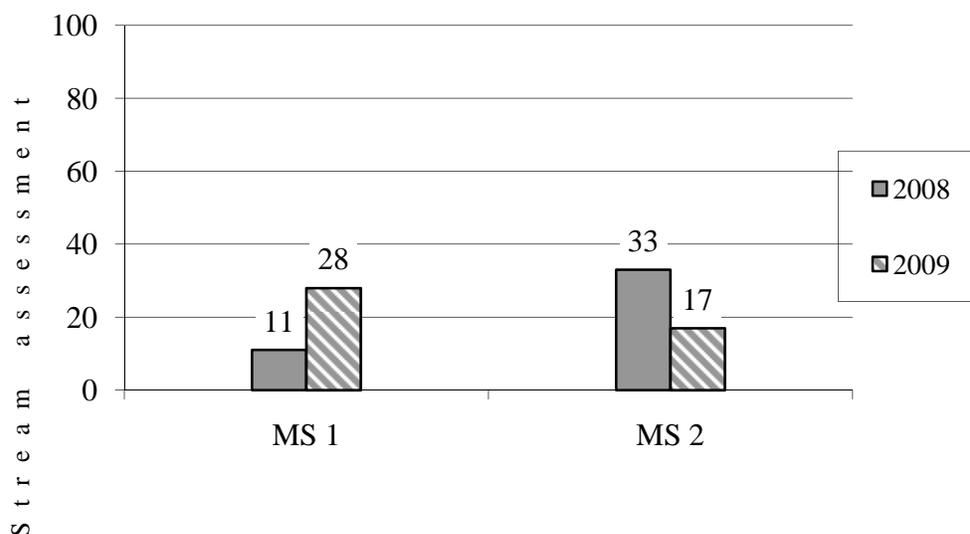

Macroinvertebrates were sampled at two locations along the newly constructed channel at the Jocko Spring Creek site (**Jocko Spring Creek Figure 2 in Appendix A**). The complete macroinvertebrate data results are included in **Appendix F** and are summarized below, in italics, by Rhithron Associates, Inc. (Bollman 2009).

The sampled sites on Jocko Spring Creek supported rheophilic taxa characteristic of flowing water and cool water temperatures unlike conditions expected in wetlands. Scores indicated in the chart were derived by means of a metric battery and scoring criteria developed for lotic conditions (MVFP index: Bollman 1998) (Chart 11). However, the MVFP index may not adequately assess spring creek fauna, which is distinctive from that of run-off dominated stream systems.

Jocko Spring Creek – MS 1 (downstream location). *Invertebrates were much more abundant in the 2009 sample than in the 2008 sample: this finding suggests improved conditions that favored colonization. Water quality and/or habitat improvements may account for the differences. Chironomids accounted for 49% of animals collected in 2009, with the Eukiefferiella Claripennis Group dominating. The abundance of this group along with numerous other midges with similar habits suggests the presence of filamentous algae or other floating algal masses. Mayflies were rare, and stoneflies were not collected in the sample. This pattern may be characteristic of stream reaches with large volumes of spring flow. The MVFP index, which indicated “moderate” impairment may overestimate degradation in such a case; however, the assessment score improved significantly since 2008 (Chart 11). Thermal preference of the sampled assemblage was estimated at 15.9C.*

Jocko Spring Creek – MS 2 (upstream location). *While the bioassessment index indicated improvement at the MS 1 site, scores for the MS 2 site worsened between 2008 and 2009 (Chart 11). The taxonomic composition of the fauna remained similar over the study period, but some caddisfly taxa were apparently lost, and the proportion of tolerant taxa increased in 2009. As a result of poor metric performance, the impairment at the site was classified as “severe”. However, just as in the case of the MS 1 site, metric expressions in the MVFP assessment tool may not adequately assess conditions in spring creeks. The fauna was not as complex as expected for a runoff dominated system, but may have been a good representation of expectations for a spring stream. Midge taxa associated with filamentous algae were common in the sample. Thermal preference of the assemblage was calculated at 16.7°C.*

Chart 11: Bioassessment scores using the MVFP index for the Jocko Spring Creek Wetland Mitigation Site.

3.2.7 Functional Assessment

The functional assessment of 2009 was compared with the baseline conditions of 2004 (**Table 17**). The completed 2009 functional assessment is included in **Appendix B**. The Jocko Spring Creek site was assessed as one area (AA-1) rated as a Category II site. Approximately 18.1 functional units occur at the Jocko Spring Creek mitigation site as of 2009 (**Table 17**).

Despite projections, the post-project assessment considered the site to have a moderate (as opposed to low) disturbance rating due to the existing agriculture to west, adjacent railroad grade and highway influence. Functional points and ratings improved significantly for several assessed parameters over baseline conditions (**Table 17**).

Table 17: Summary of baseline and 2009 wetland function/value ratings and functional points at the Jocko Spring Creek Wetland Mitigation Project.

Function and Value Parameters from the MDT Montana Wetland Assessment Method	2004 Baseline (AA-1) ¹	2009 (AA-1) ¹
Listed/Proposed T&E Species Habitat	Low (0.3)	Low (0.3)
MTNHP Species Habitat	Mod (0.6)	Mod (0.6)

Total Functional Units (acreage x actual points) (fu)	15.40	18.1
Net Acreage Gain (ac)	NA	0.08
Net Functional Unit Gain (fu)	NA	2.7

¹The baseline assessment was performed by Herrera Environmental Consultants and the 2009 assessment was completed by PBS&J; both assessments used the 1999 MDT MWAM.

3.2.8 Photographs

Representative photographs were taken in 2009 from established photo-points and transect ends (**Appendix C**).

3.2.9 Revegetation Efforts

Wetland and riparian vegetation seeding and plantings were implemented in 2006. These enhancements included broadcast seeding of a wetland seed mix and planting of native shrub and grass-like seedlings (**Appendix G**).

Survival rates for native shrub plantings were assessed in 2009. The PBS&J botanist walked three transects within the planting areas, visually assessed, counted, and recorded all live woody plantings by species (**Monitoring Form in Appendix B**). The survival transects only assessed woody species and not the grass-like species plantings. Two transects were established along the wetlands with one on both sides of wetlands near the outer edge, capturing the varying planting zones. A third survival transect was established on the north side of the railroad grade within the restored upland community.

The percentage ratings for each species' survival were not calculated due to lack of quantifiable planting numbers within the transect locations and the inherent inaccuracy with calculations based on total number of original plantings within limited transect areas. The observed plantings in all the transects looked healthy and exhibited vigorous growth for the season. A few dead species were recorded. Plantings were protected with browse control nets that offered protection from local wildlife. Plantings along the wetland fringes were flourishing and received more than adequate hydrology to sustain continued growth.

3.2.10 Maintenance Needs/Recommendations

Category 1 noxious weeds Canada thistle and hound's-tongue were present with moderate cover values (**Jocko Spring Creek Figure 3 in Appendix A**). Noxious weeds should be controlled in accordance with the *Noxious Weed Management Guidelines, Species and Control Methods for US 93 Evaro to Polson Wetland Mitigation Sites* contained in the mitigation plan (Herrera 2004).

3.2.11 Current Credit Summary

As of 2009, approximately 1.81 acres of wetland and 0.27 acres of open water / channel occurred on the mitigation site, for a total of 2.08 acres of aquatic habitat (**Table 18**). Subtracting the original 2.0 acres of pre-project wetlands from this total yields a current net of approximately 0.08 wetland/open water acres. The site has gained approximately 2.7 functional units to date (**Table 17**).

To determine the current crediting acres for the Jocko Spring Creek, the total wetland acreage was separated into the individual mitigation type zones, acreages were calculated for each type, and credit ratios were applied for both the CSKT and Corps crediting systems. The Jocko Spring Creek mitigation types consist of creation, re-establishment (Corps) / primary restoration (CSKT), and enhancement (Corps) / secondary restoration (CSKT).

The following equation calculates the enhancement ratio for the rehabilitation activities based on functional assessment scores described in preceding **Table 17**:

$$\text{Enhancement factor} = [(F_{\text{post}} - F_{\text{pre}}) / F_{\text{pre}}]$$

$$\text{Enhancement factor} = [(8.7 - 7.7) / 7.7]; \text{ Enhancement factor} = 0.13$$

$$\text{Enhancement Ratio} = 1 / 0.13; \text{ Enhancement Ratio} = 7.69$$

Table 18 lists the current credits based on Corps and CSKT credit ratios, including this year's calculated ratio for the rehabilitation areas at the Jocko Spring Creek site. The Jocko Spring Creek wetland mitigation site is progressing toward reaching the expected credits. Current credit acres are below expected credit acres, but with further development of targeted wetland creation between the highway and the railroad grade, the site could reach the mitigation goals. Functional assessment scores are predicted to increase as the vegetation matures.

Table 18: Current credits at the Jocko Spring Creek Wetland Mitigation Site.

Targeted Mitigation Type ¹	Current Wetland (Acre) ¹	Credit Ratio		Current Credit (acre)		Expected Credit (acre)	
		Corps	CSKT	Corps	CSKT	Corps	CSKT
Creation	0.66	1:1	3.36:1	0.66	0.19	2.17	1.17
Rehabilitation / primary restoration	0.82	1:1	1.86:1	0.82	0.44	0.59 ²	0.32
Enhancement / secondary restoration	0.05	7.69:1	--	0.01	0.0	0.01	0.0
Assumed pre-existing wetland (based on the site plan) occurring outside of Mitigation Type boundaries	0.55	--	--	--	--	--	--
TOTAL	2.08			1.49	0.63	2.77²	1.49

¹ Target mitigation type zone boundaries were derived from the site plan.

² Corrected from values presented in the 2007 monitoring report. The revised figures are based on the site plan (**Appendix D**).

3.3 Mission Creek

3.3.1 Hydrology

The main source of hydrology comes from the perennial Mission Creek. This creek is sourced from the Mission Reservoir and groundwater along the drainage way. This mitigation site occurs along the Mission Creek channel and restored floodplain where Highway 93 crosses at the newly constructed bridge.

According to the WRCC, mean monthly precipitation from January through July from 1896 to 2009 totaled 15.83 inches for the St Ignatius weather station (WRCC 2009). During 2009, 8.77 inches (55% of the mean) of precipitation were recorded at this station between January and July (WRCC 2009).

3.3.2 Vegetation

Forty-eight plant species were identified at the site (**Table 19**). The majority of these species are herbaceous. One wetland and one upland community type were identified and mapped at the mitigation site (**Mission Creek Figure 3 in Appendix A**). The wetland community type is Type 2: *Carex*, and the upland community type is Type 1: *Elymus*. Plant species observed within each of these communities are listed on the **Monitoring Form (Appendix B)**.

Type 2 is the wettest community type and occurred as emergent wetland community along the edge of the stream channel that receives annual inundation (**Mission Creek Figure 3 in Appendix A**). Type 2 is dominated by Nebraska sedge, fowl mannagrass, small-fruit bulrush and hardstem bulrush and sandbar willow.

Type 1 areas were mostly located within the floodplain of Mission Creek and received annual inundation. The ordinary high water mark runs across portions of the site designated as Type 1 areas. These areas were part of the restored stream channel floodplain and have been planted with riparian / wetland species. Type 1 upland areas were dominated by blue wildrye, black cottonwood, thin-leaf alder, red-osier dogwood, and woods rose.

Several noxious weeds were observed and mapped throughout the Mission Creek site (**Mission Creek Figure 3 in Appendix A**). Types 1 and 2 contained several patches of invasive species with a moderate cover class. These were individual noxious weed locations or small patches not mapped as a community type, and included Canada thistle and hound's-tongue.

Table 19: 2009 vegetation species list for the Mission Creek Wetland Mitigation Site.

Scientific Name	Common Name	Region 9 (Northwest) Wetland Indicator

<i>Verbascum thapsus</i>	common mullein	--
<i>Xanthium strumarium</i>	cocklebur	FAC

Vegetation transects were not established at the Mission Creek Site.

3.3.3 Soils

Soil at the site is mapped in the Lake County Soil Survey as Lamoose loam, 0 to 2 percent slopes, which is listed as a hydric soil for Lake County (NRCS 2009 and 2008). The Lamoose loam series are associated with floodplain landforms and have a drainage class of poorly drained (NRCS 2009).

Wetland soils observed during monitoring and documented on the Routine Wetland Determination form were mostly loams, or silt loams with very low chroma colors (1 or 2) within several inches of the surface. Redoximorphic feature such as redox concentrations or depleted matrix were not present in profiles.

3.3.4 Wetland Delineation

Wetland boundaries were delineated and mapped (**Mission Creek Figure 3 in Appendix A**). Approximately 0.02 wetland acres occur within the monitoring area (**Table 20; Mission Creek Figure 3 in Appendix A**). Consistent with the proposed plan, the acreage of Mission Creek itself was not included in wetland or floodplain totals.

Table 20: Habitats and acreages at the Mission Creek Wetland Mitigation Site.

CONDITION	2009 (acre)
Wetland	0.02
Non-Wetland Floodplain Area - Re-establishment / Enhancement	0.20
Total	0.22

A pre-project wetland delineation was not available for the Mission Creek site. The total wetland habitat at the site equates to approximately 0.02 acre (**Table 20**). The non-wetland floodplain re-establishment / enhancement areas totaled 0.2 acre (**Table 20**).

3.3.5 Wildlife

A list of fish, mammals, reptiles, amphibians, and birds found at the Mission Creek Site was developed in 2009 (**Table 21**). One mammal and three bird species were noted at the mitigation site during the 2009 site visit (**Table 21**). Specific evidence observed, as well as activity codes pertaining to birds, was recorded onto the **Monitoring Form** and **Bird Survey Form** in **Appendix B**. The removal of the existing metal pipe (culvert) and construction of an open span bridge has allowed wildlife to travel freely under the highway corridor. A significant increase in wildlife passage is expected along this drainage way.

3.3.6 Macroinvertebrates

Macroinvertebrate sampling was not conducted at the Mission Creek site.

3.3.7 Functional Assessment

The functional assessment of 2009 was compared with the baseline conditions of 2004 (**Table 10**). The completed 2009 functional assessment is included in **Appendix B**. The Mission Creek site was assessed as one area (AA-1) and rated as a Category I site, as it was during the baseline assessment. The AA encompasses portions of the up- and down-stream areas of existing forested, scrub-shrub, and emergent wetlands located on either side of restoration zones. These areas were included in the pre-project evaluation and also included in the 2009 evaluation for consistency with pre- and post-project comparison. Approximately 8 functional units occur at the Mission Creek mitigation site as of 2009 (**Table 22**).

The post-project assessment considered the site to have a moderate disturbance rating due to the existing agriculture and highway influence. Most of the assessed parameters rated moderate to high in 2009 (**Table 22**). Overall, the 2009 functional assessment was similar to the 2004 baseline conditions (**Table 22**).

3.3.8 Photographs

Representative photographs were taken in 2009 from established photo-points and transect ends (**Appendix C**).

Table 22: Summary of baseline and 2009 wetland function/value ratings and functional points at the Mission Creek Wetland Mitigation Project.

Net Functional Unit Gain (fu)	NA	Unknown

¹ The baseline assessment was performed by Herrera Environmental Consultants and the 2009 assessment was completed by PBS&J; both assessments used the 1999 MDT MWAM.

² Includes 0.02 acre of wetland and approximately 0.75 acre of Mission Creek within monitoring limits.

3.3.9 Revegetation Efforts

Wetland and riparian vegetation seeding and plantings were implemented in 2008 (**Appendix G**). These enhancements included broadcast seeding of a wetland seed mix and planting of native shrub and grass-like seedlings. Survival rates for native shrub plantings were assessed in 2009. The PBS&J botanist walked several transects within the planting areas and record all living woody plantings by species. The survival transects only assessed woody species and not the grass-like species plantings. Three areas had transects established including the southwest, southeast and northeast zones of the re-establishment areas. The channel and bridge features separated the site into four individual zones.

Survival data is detailed in the **Monitoring Form** and includes general qualitative descriptions of each species within each planting area (**Appendix B**). The percentage ratings for each species' survival were not calculated due to lack of quantifiable planting numbers within the transect locations and the inherit inaccuracy with calculations based on total number of original plantings within limited transect areas. The observed plantings along all transects looked healthy and exhibited vigorous growth for the season. Few dead individuals were recorded. Plantings along the wetland fringes were flourishing and received more than adequate hydrology to sustain continued growth.

3.3.10 Maintenance Needs/Recommendations

Category 1 noxious weeds Canada thistle and hound’s-tongue were present at moderate cover values (**Mission Creek Figure 3** in **Appendix A**). Noxious weeds should be controlled in accordance with the *Noxious Weed Management Guidelines, Species and Control Methods for US 93 Evaro to Polson Wetland Mitigation Sites* that can be found in the mitigation plan (Herrera 2004).

3.3.11 Current Credit Summary

As of 2009, the total wetland habitat at the site equates to approximately 0.02 acre, and the non-wetland floodplain re-establishment / enhancement areas totaled 0.2 acre, which comes to a grand total of 0.22acre (**Table 23**). To determine the current crediting acres for the Mission Creek site, the total wetland and non-wetland floodplain “re-establishment” acreage was subjected to agreed-upon credit ratios for both the CSKT and Corps crediting systems. The Mission Creek mitigation types consist of re-establishment (Corps) / primary restoration (CSKT).

Table 23 lists the current credits based on Corps and CSKT credit ratios for the re-establishment areas at the Mission Creek site. The Mission Creek wetland mitigation site has reached the expected credits for the proposed Corps credits. The current credits are slightly below the expected CSKT credits by 0.04 acre.

Table 23: Current credits at the Mission Creek Mitigation Site.

Targeted Mitigation Type ¹	2009 (acre) ¹	Credit Ratio		Current Credit (acre)		Expected Credit (acre)	
		Corps	CSKT	Corps	CSKT	Corps	CSKT
Rehabilitation / primary restoration areas (wetland and non-wetland per site plan)	0.22	1:1	1.86:1	0.22	0.11	0.22 ¹	0.15
TOTAL	0.22			0.22	0.11	0.22	0.15

¹Target mitigation type zone boundaries were derived from the site plan.

3.4 Mud Creek

3.4.1 Hydrology

The main source of hydrology at the Mud Creek site comes from the perennial Mud Creek. This mitigation site occurs on the west side of the highway within an existing depressional wetland that has shallow groundwater and overbank flow from the restored Mud Creek. The site receives seasonal flooding during spring runoff and sustained flows during the summer from irrigation return and groundwater sources. Inundation was present throughout all of Community Types 5 and 8 (**Mud Creek Figure 3 in Appendix A**).

According to the WRCC, mean monthly precipitation from January through July from 1896 to 2009 totaled 15.83 inches for the St Ignatius weather station (WRCC 2009). During 2009, 8.77 inches (55% of the mean) of precipitation were recorded at this station between January and July (WRCC 2009).

3.4.2 Vegetation

Sixty-eight plant species were identified at the site in 2009 (**Table 24**). The majority of these species are herbaceous. The site has a small area of existing riparian shrub species. Seven wetland and one upland community types were identified and mapped at the mitigation site (**Mud Creek Figure 3 in Appendix A**). The seven wetland community types were Type 1: *Juncus*, Type 2: *Phalaris*, Type 3: *Scirpus*; Type 4: *Juncus / Carex*, Type 5: *Carex*, Type 6: *Crataegus / Phalaris*, and Type 8: *Elodea*. The upland community type was Type 7: *Phalaris / Melilotus*. Plant species observed within each of these communities are listed on the **Monitoring Form (Appendix B)**.

Community types 5 and 8 are the wettest and occurred as emergent types along the Mud Creek floodplain; these community types were inundated throughout most the growing season.

Community type 8 consisted of aquatic vegetation in the Mud Creek channel and was inundated with perennial surface waters (**Mud Creek Figure 3 in Appendix A**). Type 1 was dominated by Baltic rush with a small inclusion of redtop and reed canarygrass. Type 2 was dominated by reed canarygrass with a small inclusion of sawtooth sedge, mannagrass, and redtop. Type 3 was dominated by a slightly wetter species mix including small-fruit bulrush, sedge, fowl mannagrass, and big-leaf avens. Types 3 and 4 are located within an area of existing wetlands. Type 4 was dominated by Nebraska sedge, Baltic rush, sawtooth sedge and other sedges and rushes. Type 6 was the driest wetland area and was dominated by remnant riparian shrubs (i.e., Douglas hawthorn) and emergent vegetation (i.e., reed canarygrass). Type 6 occurred in both wetland and upland areas within the mitigation site.

Adjacent upland vegetation communities were dominated by aggressive invasive species. Type 7 is an upland area dominated by reed canarygrass, white clover, yellow clover, tumble mustard, and smooth brome.

Several noxious weeds were observed throughout the Mud Creek site. Type 7 had a moderate amount of invasive species located throughout. Noxious weed locations observed during the 2009 field visit were mapped (**Mud Creek Figure 3 in Appendix A**). These were individual noxious weed locations or small patches not mapped as a community type, and included Canada thistle, St. John’s wort, oxeye daisy, and yellow iris.

Vegetation transect results were detailed in the **Monitoring Form (Appendix B)** and were summarized in tabular format in **Table 25**, and graphically illustrated in **Charts 12-13**.

Table 25: Mud Creek - Transect 1 data summary.

Monitoring Year	2009

% Transect Length Comprised of Upland Vegetation Communities	0
% Transect Length Comprised of Unvegetated Open Water	0
% Transect Length Comprised of Bare Substrate	0

Chart 12: Mud Creek - Transect 1 map showing vegetation types from the start (0 feet) to the end (494 feet) for 2009.

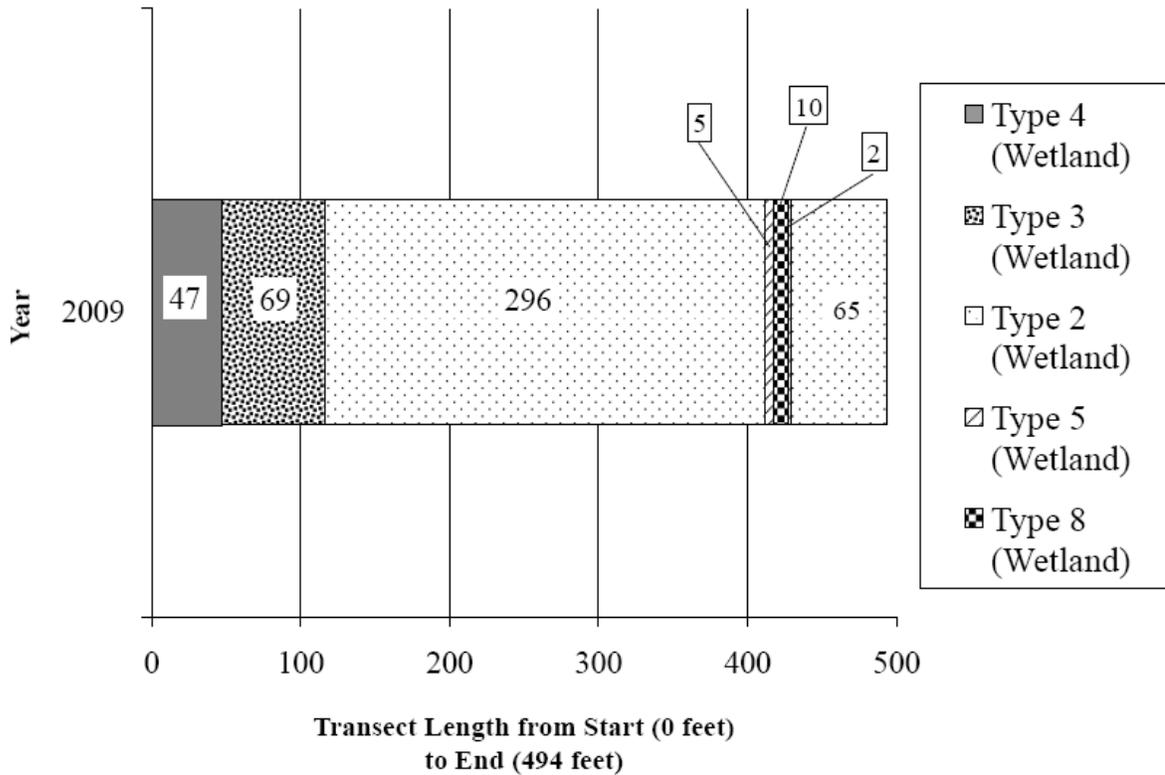

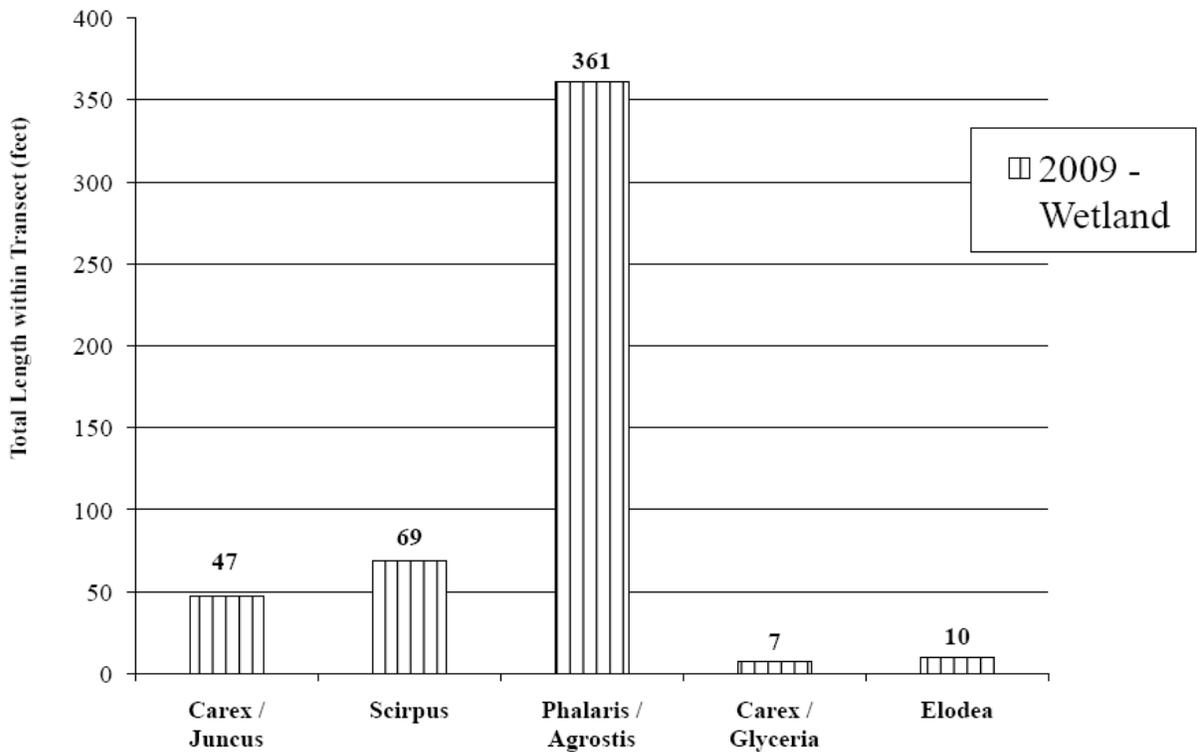

Chart 13: Mud Creek - length of vegetation communities within Transect 1 for 2009.

3.4.3 Soils

Soils at the Mud Creek site are mapped in the Lake County Soil Survey as Borohemists, 0 to 1 percent slopes (NRCS 2009). The Borohemists series was listed as hydric and is very poorly drained and associated with floodplain type landforms.

Wetland soils observed during monitoring and documented on the Routine Wetland Determination form were mostly loams and muck with very low chroma colors (1 or 2) within 12 inches of the surface. Redoximorphic features were not present in soil profiles.

3.4.4 Wetland Delineation

Wetlands were delineated and their boundaries were mapped in 2009 (**Mud Creek Figure 3 in Appendix A**). Approximately 2.02 wetland acres currently occur within the monitoring area (**Table 26; Mud Creek Figure 3 in Appendix A**).

A pre-construction wetland delineation was not available. The site currently contains 2.02 acres of aquatic habitat (**Mud Creek Figure 3 in Appendix A**).

Table 26: Aquatic habitats and acreages at the Mud Creek Wetland Mitigation Site.

CONDITION	2009 (acre)
Wetland Area	2.02
Total Aquatic Habitat Area	2.02

3.4.5 Fish and Wildlife

A list has been made of the fish, mammal, reptile amphibian, and bird species observed in 2009 at the Mud Creek Site (**Table 27**). Specific evidence observed, as well as activity codes pertaining to birds, was recorded onto the **Monitoring Form** and **Bird Survey Form** in **Appendix B**. Two mammals and three bird species were noted at the mitigation site during the 2009 site visits (**Table 27**).

Table 27: Fish and wildlife species observed at the Mud Creek Wetland Mitigation Site in 2009.

Bolded species were observed by MDT and CSKT staff.

3.4.6 Macroinvertebrates

Macroinvertebrate sampling was not conducted at the Mud Creek Site.

3.4.7 Functional Assessment

The functional assessment of 2009 was compared with the baseline conditions of 2004 (**Table 28**). The completed 2009 functional assessment is included in **Appendix B**. The Mud Creek site was assessed as one area (AA-1), which rated as a Category III site. Approximately 15.76 functional units occurred at the Mud Creek mitigation site in 2009 (**Table 28**).

3.4.8 Photographs

Representative photographs were taken in 2009 from established photo-points and transect ends (**Appendix C**).

Table 28: Summary of baseline and 2009 wetland function/value ratings and functional points at the Mud Creek Wetland Mitigation Project.

Net Functional Unit Gain (fu)	NA	Unknown

¹ The baseline assessment was performed by Herrera Environmental Consultants and the 2009 assessment was completed by PBS&J; both assessments used the 1999 MDT MWAM.

3.4.9 Revegetation Efforts

Wetland and riparian vegetation enhancements were implemented in 2008 (**Appendix G**). These enhancements included planting of native containerized trees, shrubs, and grass-like seedlings. Plants were installed along the restored banks and adjacent floodplain of Mud Creek.

Shrub and tree planting survival data were collected along one 2-meter wide belt transect. The transect was established along the north side of Mud Creek and followed the channel sinuosity. Species survival was based on visual estimates and counts for each live species. The original planting numbers in **Appendix G** were referenced from the *Mud Creek Wetland Mitigation Planting Summary*. Actual planting numbers and prescribed species may vary from the original plan. Post- design changes for planting prescriptions may have been adjusted during the construction phase due to availability of seedlings. Overall, survival ratings were considered moderate to high based on the 2009 visual assessment. Plant growth was vigorous and looked healthy and few discolored leaves were found.

3.4.10 Maintenance Needs/Recommendations

Three Category 1 noxious weeds were present at low to high cover values: Canada thistle, oxeye daisy, and hound's-tongue (**Figure 3, Appendix A**). A Category 2 noxious weed, yellowflag iris, was also present within the mitigation site. Noxious weeds should be controlled in accordance with the *Noxious Weed Management Guidelines, Species and Control Methods for*

US 93 Evaro to Polson Wetland Mitigation Sites that can be found in the mitigation plan (Herrera 2004).

3.4.11 Current Credit Summary

As of 2009, approximately 2.02 acres of wetland occur on the mitigation site. The channel was included in the wetland totals. Additional acreage may form with additional time and continued increase in hydrology levels. The site scores approximately 15.15 functional units as of 2009.

To determine the current crediting acres for the Mud Creek site, the total wetland acreage was separated into the individual mitigation type zones, acreages were calculated for each type, and credit ratios were applied for both the CSKT and Corps crediting systems. The Mud Creek site mitigation types consisted of creation and rehabilitation (Corps) / secondary restoration (CSKT).

The following equation calculates the enhancement ratio for the rehabilitation activities based on functional assessment scores described in preceding **Table 28**:

$$\text{Enhancement factor} = [(F_{\text{post}} - F_{\text{pre}}) / F_{\text{pre}}]$$

$$\text{Enhancement factor} = [(7.5 - 6.1) / 6.1]; \text{ Enhancement factor} = 0.23$$

$$\text{Enhancement Ratio} = 1 / 0.23; \text{ Enhancement Ratio} = 4.35$$

Table 29 lists the current credits based on Corps and CSKT credit ratios, including this year's calculated ratio for the rehabilitation areas at the Mud Creek site. Current credits are well below the expected credits, due to apparent discrepancy in the original acreage calculation in the mitigation plan. The mitigation plan proposed a total of 6.81 acres, but in actuality, following construction, the total area of the site is 2.54 acres, including 0.52 acres of uplands. Construction plans were followed as specified in the plan and existing conditions at the site are similar to the proposed design plan. This discrepancy of 4.8 acres of wetlands leaves the site well below expected credits. The site is predicted to continue gaining functional points as the wetlands continue to develop.

Table 29: Current credits at the Mud Creek Wetland Mitigation Site.

Targeted Mitigation Type	Current Wetland (acre)	Credit Ratio		Current Credit (acre)		Expected Credit (acre)	
		Corps	CSKT	Corps	CSKT	Corps	CSKT
Creation	1.49	1:1	3.36:1	1.49	0.44	6.18	3.22
Rehabilitation / secondary restoration	0.53	4.35:1	1.86:1	0.12	0.28	0.63	0.33
TOTAL	2.02	--	--	1.61	0.72	6.81	3.55

3.5 Peterson

3.5.1 Hydrology

The main source of hydrology at the Peterson site comes from an unnamed perennial tributary of Post Creek. This mitigation site occurs within a long wetland swale that runs east to west. The site receives seasonal flooding during spring runoff and sustained flows during the summer from irrigation return. As part of the mitigation activities, twelve log crib structures were installed to create shallow inundation behind the structures. The site exhibited shallow inundation of varying extents behind these impoundments during the monitoring visit. Each crib structure was designed to allow surface flow to spill through a designated overflow. Inundation was present throughout all of Community Types 2, 3, and 4 (**Peterson Figure 3** in **Appendix A**).

According to the WRCC, mean monthly precipitation from January through July from 1896 to 2009 totaled 15.83 inches for the St Ignatius weather station (WRCC 2009). During 2009, 8.77 inches (55% of the mean) of precipitation were recorded at this station between January and July (WRCC 2009).

3.5.2 Vegetation

Sixty-seven plant species were identified at the site (**Table 30**). The majority of these species are herbaceous. The site has no woody vegetation, except for the plantings installed as part of the mitigation efforts to enhance scrub-shrub habitat. Three wetland and one upland community types were identified and mapped at the mitigation site (**Peterson Figure 3** in **Appendix A**). The three wetland community types were Type 2: *Phalaris*, Type 3: *Phalaris/Typha*, and Type 4: *Carex/Poa*. The upland community type was Type 1: *Agropyron*. Plant species observed within each of these communities are listed on the **Monitoring Form** (**Appendix B**).

Table 30: 2008 to 2009 vegetation species list for the CSKT Peterson Wetland Mitigation Site.

<i>Trifolium pratense</i>	red clover	FACU
<i>Trifolium</i> spp.	clover	--
<i>Typha latifolia</i>	broad-leaf cattail	OBL

Bolded species were observed for the first time in 2009.

Community types 2 and 3 were the wettest and occurred as aquatic bed/emergent wetlands in the shallow water impounded behind the log crib structures (**Peterson Figure 3 in Appendix A**). Type 2 was dominated by a monoculture of reed canarygrass with a small inclusion of teasel. Type 3 was dominated by a slightly better diversity and included cattail, reed canarygrass, beaked sedge, tall mannagrass, and rush (*Juncus* spp.). Reed canarygrass and cattail had the highest cover values for this community type and were inundated with shallow water. Type 4 is dominated by slightly drier species mix and occurred in the transition zone between the wettest inundated areas and the dry outer fringes of the wetland. Type 4 was dominated by Nebraska sedge and fowl bluegrass, with small amounts of reed canarygrass, teasel, and common plantain.

Adjacent upland vegetation communities were dominated by pasture grasses and/or aggressive invasive species. Type 1 was upland and was dominated by pasture grasses (i.e., quackgrass, Kentucky bluegrass, clasping pepperweed, field pepperweed, teasel, tumble mustard, sulfur cinquefoil, and whitetop).

Several noxious weeds were observed throughout the Peterson site. Type 1 had a moderate amount of invasive species located throughout it. Noxious weed locations observed during the 2009 field visit were mapped (**Peterson Figure 3 in Appendix A**). These were individual noxious weed locations or small patches not mapped as a community type, and included Canada thistle, yellow iris, and whitetop (*Cardaria draba*). Several other noxious weed species were recorded only at the community level and therefore were not mapped.

Vegetation transect results are detailed in the **Monitoring Form (Appendix B)** and are summarized in tabular format (**Tables 31 and 32**), and are graphically illustrated (**Charts 14 to 17**).

Table 31: CSKT Peterson - Transect 1 data summary.

Monitoring Year	2008	2009
Transect Length (feet)	144	144

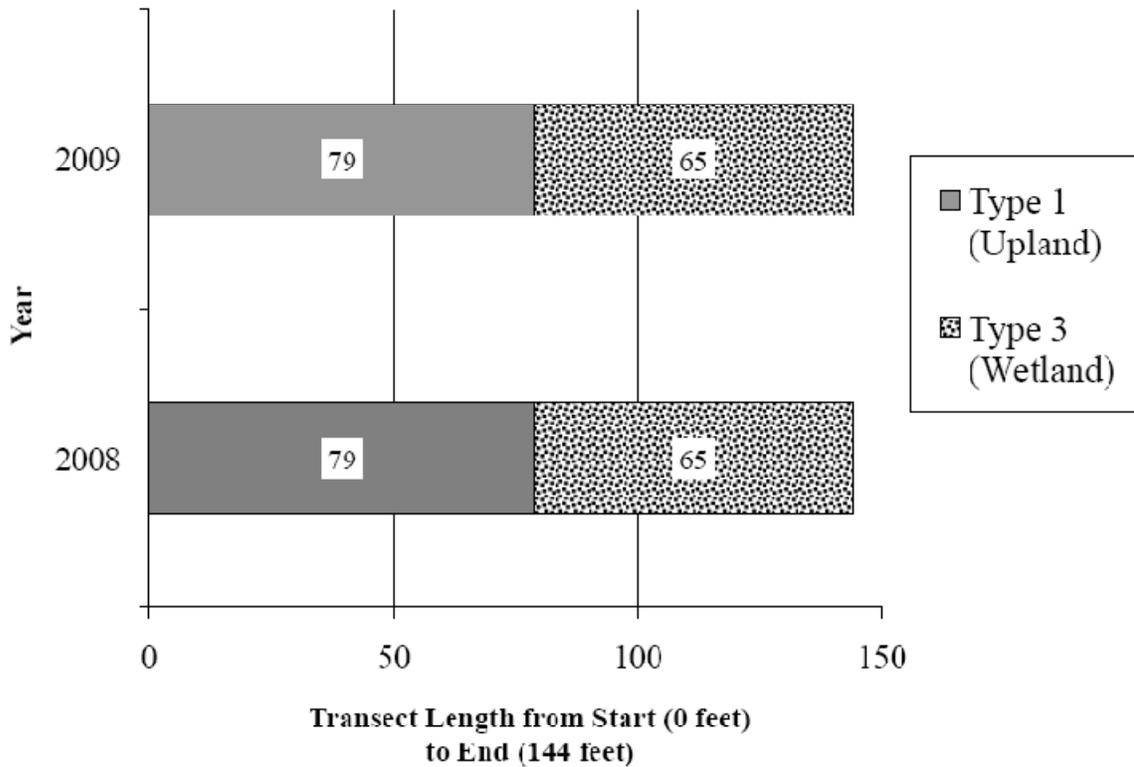

Chart 15: CSKT Peterson - length of vegetation communities within Transect 1 from 2008 to 2009.

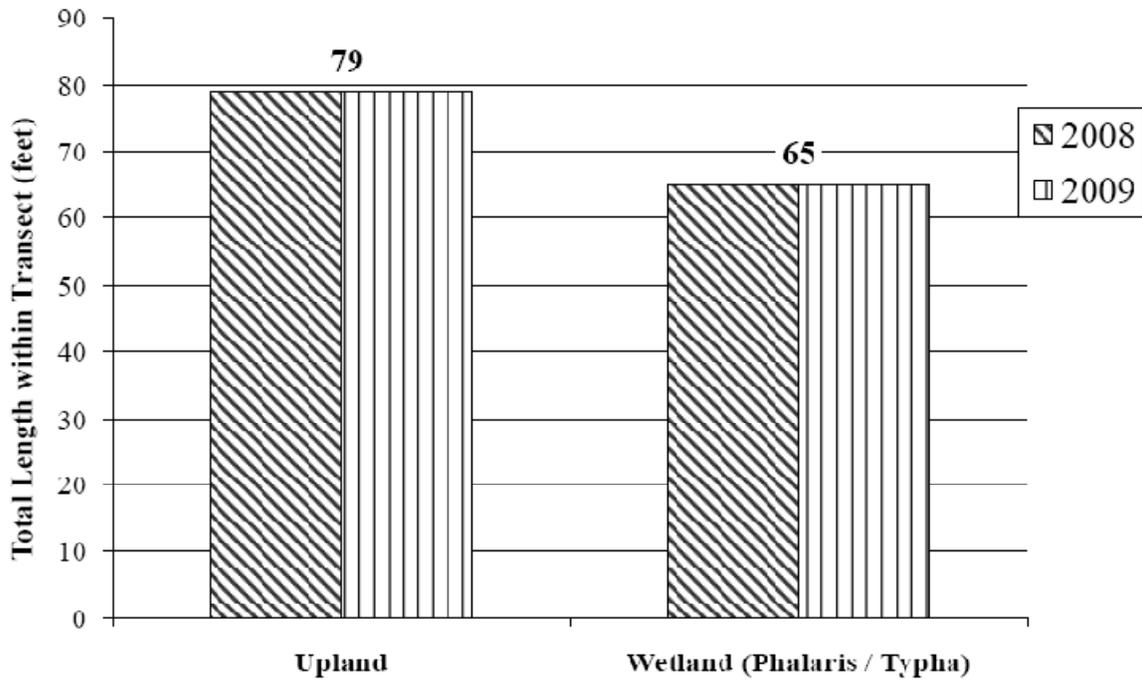

Chart 16: CSKT Peterson - Transect 2 map showing vegetation types from the start (0 feet) to the end (325 feet) for each year monitored.

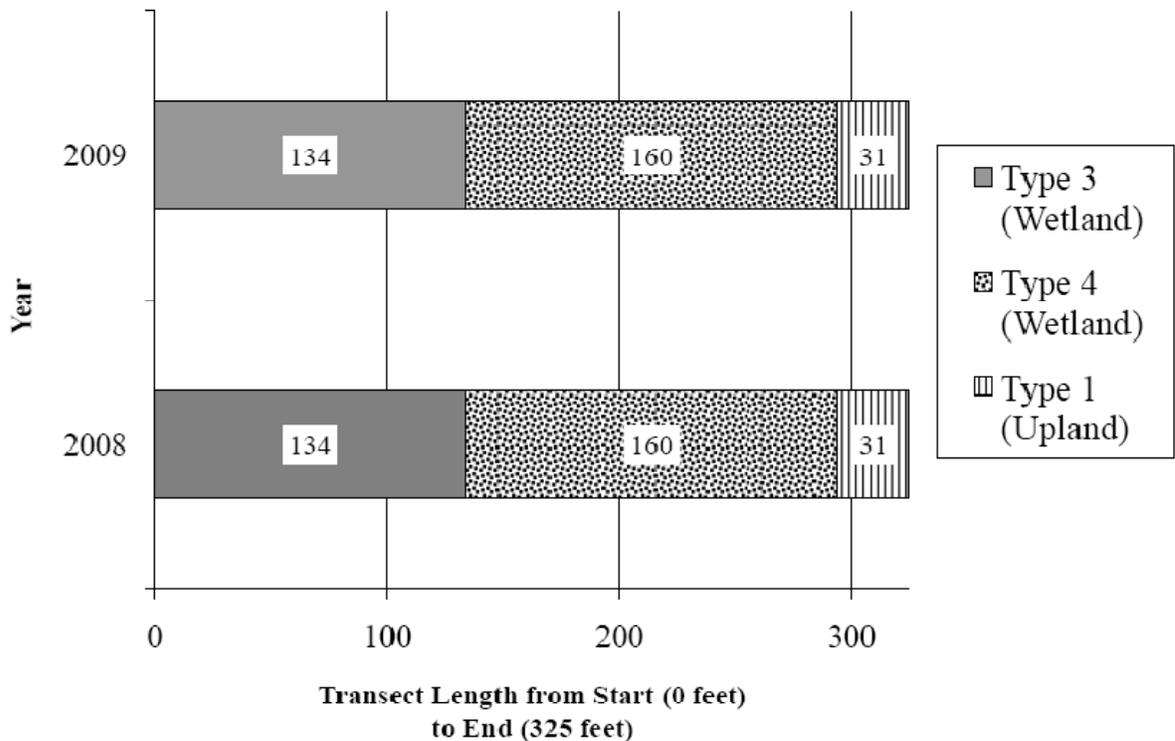

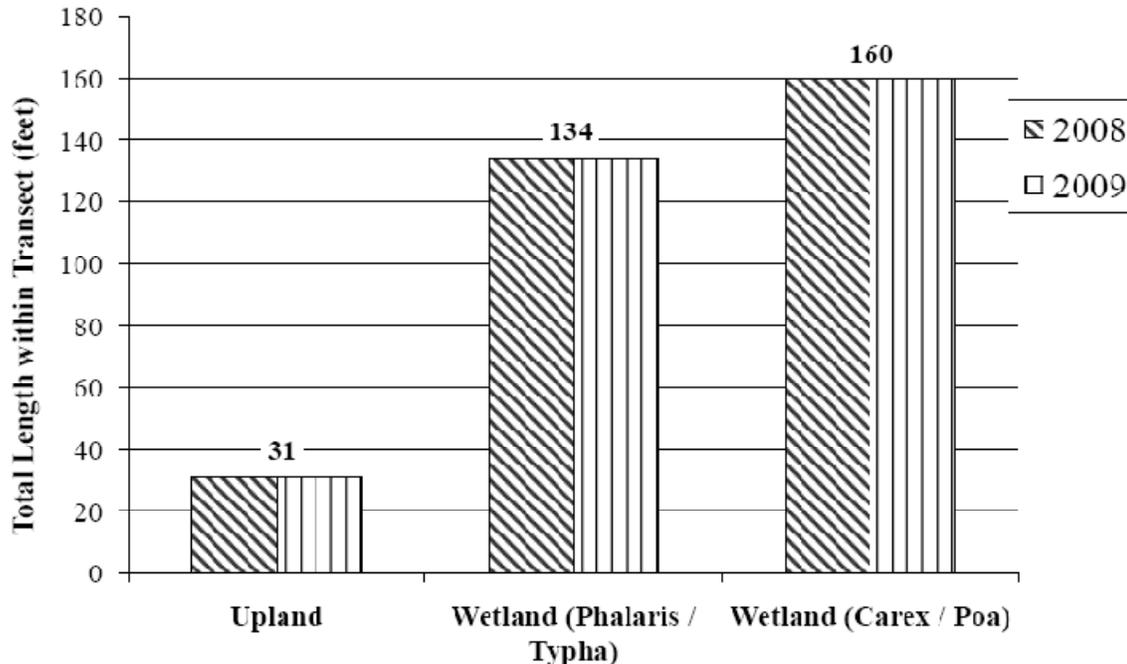

Chart 17: CSKT Peterson - length of vegetation communities within Transect 2 from 2008 to 2009.

3.5.3 Soils

Soils at the Peterson site are mapped in the Lake County Soil Survey as Colake silt loam, 0 to 1 percent slopes, Ronan silty clay loam, 4 to 8 percent slopes, Ronan silty clay loam, 2 to 4 percent slopes, and Post silty clay loam, 2 to 4 percent slopes (NRCS 2009). The Colake series was listed as hydric and is poorly drained. Colake series are associated with till plain type landforms and parent material consisting of calcareous alluvium. The Colake series polygon boundary at the Peterson site coincides with the long shallow topographic wetland swale that comprises the mitigation site. The remaining three soil series were located in the areas outside the wetland swale and were not considered hydric. The two Ronan silty clay loam series and the Post silty clay loam series are all well drained soils and are associated with lake plains and moraines.

Wetland soils observed during monitoring and documented on the Routine Wetland Determination form were mostly loams and silt loams with very low chroma colors (1 or 2) within 2 inches of the surface (**COE Forms in Appendix B**). Redoximorphic features were not present in soil profiles.

3.5.4 Wetland Delineation

Wetlands were delineated and their boundaries mapped (**Peterson Figure 3 in Appendix A**). Approximately 3.71 wetland acres occurred within the monitoring area in 2009 (**Table 33; Peterson Figure 3 in Appendix A**). A pre-construction wetland delineation was not available.

Table 33: Wetland acreages at the CSKT Peterson Wetland Mitigation Site.

CONDITION	2009 (acre) ¹
Wetland Area	3.71
Total Aquatic Habitat Area	3.71

¹Similar acreage as observed in 2008.

3.5.5 Fish and Wildlife

A comprehensive list of fish, mammals, reptiles, amphibians, and birds using the Peterson Site has been maintained since 2008 (**Table 34**). Several mammal and bird species were noted at the mitigation site during 2009 (**Table 34**). Specific evidence observed, as well as activity codes pertaining to birds, was recorded onto the **Monitoring Form** and **Bird Survey Form** in **Appendix B**.

3.5.6 Macroinvertebrates

Macroinvertebrate sampling was not conducted at the Peterson Site.

Table 34: Fish and wildlife species observed at the Peterson Wetland Mitigation Site from 2008 to 2009.

FISH	
Unidentified spp.*	
AMPHIBIAN

MAMMAL	
Black Bear (<i>Ursus americanus</i>)	Raccoon (<i>Procyon lotor</i>)
Deer (<i>Odocoileus spp.</i>)	Voies (<i>Microtus spp.</i>)
Muskrat (<i>Ondatra zibethicus</i>)	

Bolded species were observed during the 2009 monitoring.

*Observed by MDT staff

3.5.7 Functional Assessment

The functional assessment of 2009 was compared with the baseline conditions of 2004 (**Table 35**). The completed 2009 functional assessment is included in **Appendix B**. The Peterson site was assessed as one area (AA-1), which rated as a Category III site in 2009. Approximately 25.23 functional units occurred at the Peterson mitigation site in 2009 (**Table 35**).

3.5.8 Photographs

Representative photographs were taken in 2009 from established photo-points and transect ends (**Appendix C**).

Table 35: Summary of baseline and 2009 wetland function/value ratings and functional points at the Peterson Wetland Mitigation Project.

Function and Value Parameters from the MDT Montana Wetland Assessment Method	2004 Baseline (AA-1) ¹	2009 (AA-1) ²
Listed/Proposed T&E Species Habitat	Low (0.3)	Low (0.3)
MTNHP Species Habitat	Low (0.1)	Low (0.1)
General Wildlife Habitat	Low (0.5)	Mod (0.7)
General Fish/Aquatic Habitat	Low (0.1)	NA
Flood Attenuation	Low (0.2)	Mod (0.4)
Short and Long Term Surface Water Storage	Mod (0.4)	High (0.8)
Sediment/Nutrient/Toxicant Removal	High (0.9)	High (0.9)
Sediment/Shoreline Stabilization	High (0.7)	High (1.0)
Production Export/Food Chain Support	High (0.8)	High (0.8)
Groundwater Discharge/Recharge	High (1.0)	High (1.0)
Uniqueness	Low (0.2)	Low (0.3)
Recreation/Education Potential	Low (0.1)	Mod (0.5)
Actual Points / Possible Points	5.3 / 12	6.8 / 11
% of Possible Score Achieved	44%	61%
Overall Category	III	III
Total Acreage of Assessed Wetlands and Open Water within Easement (ac)	1.26	3.71
Total Functional Units (acreage x actual points) (fu)	6.68	25.23
Net Acreage Gain (ac)	NA	2.45
Net Functional Unit Gain (fu)	NA	18.43

¹The baseline assessment was performed by Herrera Environmental Consultants and the 2009 assessment was completed by PBS&J; both assessments used the 1999 MDT MWAM.

3.5.9 Revegetation Efforts

Wetland and riparian vegetation enhancements were implemented in 2007 (**Appendix G**). These enhancements included planting of native containerized and cutting shrubs and grass-like seedlings. Plants were installed along the constructed log crib structures, excavated oxbow depressions, fringe of the wetlands, and disturbed areas.

Shrub planting survival data were collected along several 2-meter wide belt transects of varying lengths. Transects were established along the edges of the wetland draw encompassing creation and enhancement mitigation areas. One transect was placed along a log crib structure. Species

survival was based on visual estimates and counts for each live species. The original planting numbers in **Appendix G** were referenced from *Peterson Tract Wetland Mitigation Site –Planting Summary*. Actual planting numbers and prescribed species may vary from the original plan. Three species were found that were not listed in the original planting summary. Post- design changes for planting prescriptions may have been adjusted during the construction phase due to availability of seedlings. Overall, survival ratings were considered moderate to high based on the 2009 visual assessment. Plant growth was vigorous and looked healthy with few discolored leaves. Browse protection was intact and properly functioning.

3.5.10 Maintenance Needs/Recommendations

Four Category 1 noxious weeds were present at low to high cover values: Canada thistle, oxeye daisy, sulfur cinquefoil, and whitetop (**Figure 3, Appendix A**). A Category 3 noxious weed, yellowflag iris, was also present within the mitigation site. Noxious weeds should be controlled in accordance with the *Noxious Weed Management Guidelines, Species and Control Methods for US 93 Evaro to Polson Wetland Mitigation Sites* that can be found in the mitigation plan (Herrera 2004).

Log crib structures were assessed for general functionality and were generally considered to be operational, with shallow inundation observed behind the impoundments. However, undercutting and substantive leakage between logs was observed at many of the structures. Subsequent to monitoring, MDT installed additional straw bales and rock at the structures to facilitate sediment entrapment, vegetation establishment, and sealing.

3.5.11 Current Credit Summary

As of 2009, approximately 3.71 acres of wetland occur on the mitigation site. The channel was included in the wetland totals. Additional acreage may form with additional time and continued increase in hydrology levels. The site scores approximately 25.23 functional units as of 2009.

To determine the current crediting acres for the Peterson site, the total wetland acreage was separated into the individual mitigation type zones, acreages were calculated for each type, and credit ratios were applied for both the CSKT and Corps crediting systems. The Peterson site mitigation types consisted of creation and rehabilitation (Corps) / secondary restoration (CSKT).

The following equation calculates the enhancement ratio for the rehabilitation activities based on functional assessment scores described in preceding **Table 35**:

$$\text{Enhancement factor} = [(F_{\text{post}} - F_{\text{pre}}) / F_{\text{pre}}]$$

$$\text{Enhancement factor} = [(6.8 - 5.3) / 5.3]; \text{ Enhancement factor} = 0.28$$

$$\text{Enhancement Ratio} = 1 / 0.28; \text{ Enhancement Ratio} = 3.57$$

Table 36 lists the current credits based on Corps and CSKT credit ratios, including this year's calculated ratio for the rehabilitation areas at the Peterson site. Current credits have exceeded the expected credits, assuming that wetlands delineated outside of the targeted creation and rehabilitation areas were created by project implementation. The site is predicted to continue gaining functional points as the wetlands continue to develop.

Table 36: Current credits at the CSKT Peterson Property Wetland Mitigation Site.

Targeted Mitigation Type	Current Wetland (acre)	Credit Ratio		Current Credit (acre)		Expected Credit (acre)	
		Corps	CSKT	Corps	CSKT	Corps	CSKT
Creation	2.46 ¹	1:1	3.36:1	2.46	0.73	2.14	0.64
Rehabilitation / secondary restoration	1.25	3.57:1	1.86:1	0.35	0.67	0.25	0.67
TOTAL	3.71	--	--	2.81	1.40	2.39	1.31

¹ Includes wetlands delineated outside of targeted creation and rehabilitation areas and assumed to have been created by project implementation.

PBS&J / MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: **Bouchard** Project Number: **4308802**
 Assessment Date: **July 22, 2009** Person(s) conducting the assessment: **G. Howard**
 Location: **Arlee** MDT District: **Missoula** Milepost: _____
 Legal Description: T **17N** R **20W** Section **26**
 Weather Conditions: _____ Time of Day: _____
 Initial Evaluation Date: **July 29, 2008** Monitoring Year: **3** # Visits in Year: **1**
 Size of evaluation area: **40 acres** Land use surrounding wetland: **Agriculture and residential**

HYDROLOGY

Surface Water Source: **groundwater (Spring Creek)**
 Inundation: **Present** Average Depth: **0.5 feet** Range of Depths: **0.5 - 4ft/**
 Percent of assessment area under inundation: **25%**
 Depth at emergent vegetation-open water boundary: _____ **feet**
 If assessment area is not inundated then are the soils saturated within 12 inches of surface: **—**
 Other evidence of hydrology on the site (ex. – drift lines, erosion, stained vegetation, etc.):

Groundwater Monitoring Wells: **Absent**
 Record depth of water below ground surface (in feet):

Well Number	Depth	Well Number	Depth	Well Number	Depth

- Additional Activities Checklist:
- Map emergent vegetation-open water boundary on aerial photograph.
 - Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining, etc.)
 - Use GPS to survey groundwater monitoring well locations, if present.

COMMENTS / PROBLEMS:

The mitigation site consists of a 40-acre parcel dominated by emergent, scrub-shrub and forested vegetation types. Site does not receive any direct surface water. Site is influenced by groundwater. Several small ponds exist that are also sourced by groundwater. These areas were previously sourced by irrigation water from the spring creek that is located adjacent to the southeast corner of the parcel. The values specified for the range of depths includes both constructed shallow depression and existing small ponds. The constructed shallow depression has an average depth of approximately 6 inches. Site conditions are similar to those observed in 2008 with an increase in inundation in the created wetland zones.

VEGETATION COMMUNITIES

<i>Epilobium ciliatum</i>	2,3,4,5	<i>Sonchus arvensis</i>	1,4,5
<i>Epilobium spp.</i>	2,3,4,5	<i>Symphoricarpos albus</i>	1,6
<i>Equisetum arvense</i>	2,3,5	<i>Typha latifolia</i>	2,3,9
<i>Geum macrophyllum</i>	2,3,5,6,7	<i>Verbascum thapsus</i>	1
<i>Glyceria grandis</i>	5,7	<i>Vicia spp.</i>	1
<i>Glyceria striata</i>	5,7		

Comments / Problems: Two new species identified in 2009 including *Chara spp.* and *Juncus mertensianus.*

PLANTED WOODY VEGETATION SURVIVAL

Plant Species	Number Originally Planted	Number Observed	Mortality Causes
ALNINC	--	99	Plantings looked healthy with vigorous growth for the season with few discolored leaves. Browse protection were intact and properly functioning. Water birch and red-osier dogwood species had the highest counts within transects.
BETOCC	817	120	
CORSTO	408	97	
CRADOU	--	7	
RIBHUD	245	21	
ROSWOO	--	3	
SALSPP	408	58	
SYMALB	--	9	

Comments / Problems: Shrub planting survival data was collected along ten (240 feet long) 2 meter wide belt transects that totaled approximately 0.35 acres (15,600 sq. ft.). Transects were randomly established across the wetland creation area perpendicular to southern boundary. Transects were walked from south to north across this mitigation type. During the 2009 monitoring, species survival was based on visual estimates and counts for each live species. The original plantings numbers as listed above were referenced from Bouchard Wetland – Wetland Planting Summary (**Appendix G**). Actual planting numbers and prescribed species may vary from the original plan. Three species were found that were not listed in the original planting summary. Post design changes for planting prescriptions were adjusted during the construction phase due to availability of seedlings. Overall survival ratings are considered moderate to high based on visual assessment. Plant growth was vigorous and looked healthy with few discolored leaves. Browse protection were intact and properly functioning.

WILDLIFE

Birds

Were man-made nesting structures installed? **No**
 If yes, type of structure: _____ How many? _____
 Are the nesting structures being used? **NA**
 Do the nesting structures need repairs? _____

Comments / Problems: _____

PHOTOGRAPHS

Using a camera with a 50mm lens and color film take photographs of the following permanent reference points listed in the check list below. Record the direction of the photograph using a compass. When at the site for the first time, establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3 feet above ground. Survey the location with a resource grade GPS and mark the location on the aerial photograph.

Photograph Checklist:

- One photograph for each of the four cardinal directions surrounding the wetland.
- At least one photograph showing upland use surrounding the wetland. If more than one upland exists then take additional photographs.
- At least one photograph showing the buffer surrounding the wetland.
- One photograph from each end of the vegetation transect, showing the transect.

Location	Photograph Frame #	Photograph Description	Compass Reading (°)
PP1	1.0	View looking north.	0
PP1	1.1	View looking north.	0

PP10	1.1	View looking northeast.	45
PP11	1.0	View looking northwest.	315

Comments / Problems: Refer to photopage for a decription of each photo point.

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points set at a 5 second recording rate. Record file numbers for site in designated GPS field notebook.

GPS Checklist:

- Jurisdictional wetland boundary.
- 4-6 landmarks that are recognizable on the aerial photograph.
- Start and End points of vegetation transect(s).
- Photograph reference points.
- Groundwater monitoring well locations.

Comments / Problems: _____

WETLAND DELINEATION

(attach COE delineation forms)

At each site conduct these checklist items:

- Delineate wetlands according to the 1987 Army COE manual.
 - Delineate wetland – upland boundary onto aerial photograph.
- Yes** Survey wetland – upland boundary with a resource grade GPS survey.

Comments / Problems: _____

FUNCTIONAL ASSESSMENT

(Complete and attach full MDT Montana Wetland Assessment Method field forms.)
(Also attach any completed abbreviated field forms, if used)

Comments / Problems: **FA completed using 1999 MDT Montana Wetland Assessment Method. Mitigation credit system requires direct comparison between pre-and post-project using the 1999 methods to show a functional shift.**

MAINTENANCE

Were man-made nesting structure installed at this site? **No**

If yes, do they need to be repaired? **NA**

If yes, describe the problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures built or installed to impound water or control water flow into or out of the wetland? **No**

If yes, are the structures working properly and in good working order? **NA**

If no, describe the problems below.

Source

P = Planted
V = Volunteer

Percent of perimeter developing wetland vegetation (excluding dam/berm structures): ____%

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at the point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 foot wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S _____
- Incidental habitat (list species) D S Grizzly Bear, Canada Lynx
- No usable habitat D S _____

ii. **Rating** (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.3 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S _____
- Incidental habitat (list species) D S Bald Eagle, Townsend's Big-eared Bat, Western Toad
- No usable habitat D S _____

iii. **Rating** (Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level:	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.1 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14C. General Wildlife Habitat Rating

i. **Evidence of overall wildlife use in the AA:** (Check either substantial, moderate, or low)

Substantial (based on any of the following)

- observations of abundant wildlife #s or high species diversity (during any period)
- abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
- presence of extremely limiting habitat features not available in the surrounding area
- interviews with local biologists with knowledge of the AA

Low (based on any of the following)

- few or no wildlife observations during peak use periods
- little to no wildlife sign
- sparse adjacent upland food sources
- interviews with local biologists with knowledge of AA

Moderate (based on any of the following)

- observations of scattered wildlife groups or individuals or relatively few species during peak periods
- common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
- adequate adjacent upland food sources
- interviews with local biologists with knowledge of the AA

ii. **Wildlife Habitat Features** (Working from top to bottom, select appropriate AA attributes to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from #13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see #10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from #13)	<input checked="" type="checkbox"/> High								<input type="checkbox"/> Moderate								<input type="checkbox"/> Low			
Class Cover Distribution (all vegetated classes)	<input type="checkbox"/> Even				<input checked="" type="checkbox"/> Uneven				<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even			
Duration of Surface Water in ≥ 10% of AA	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Low disturbance at AA (see #12)	--	--	--	--	--	E	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
High disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. **Rating** (Using 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.)

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input checked="" type="checkbox"/> Exceptional	<input type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	--	--	--
Moderate	.9 (H)	--	--	--
Low	--	--	--	--

Comments: _____

14D. GENERAL FISH/AQUATIC HABITAT RATING NA (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.)

Duration of Surface Water in AA	<input type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

Y N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: E H M L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	--	--	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: _____

14E. FLOOD ATTENUATION NA (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow.

If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input type="checkbox"/> <10, >2 acres			<input type="checkbox"/> ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains no outlet or restricted outlet	--	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	--	--	--	--

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check) Y N Comments: _____

14F. SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input checked="" type="checkbox"/> >5 acre feet			<input type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	--	.9 (H)	--	--	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL NA (proceed to 14H)

Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input checked="" type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No
Evidence of flooding or ponding in AA	1 (H)	--	--	--	--	--	--	--
AA contains no or restricted outlet	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/Shoreline Stabilization

NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	--	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input checked="" type="checkbox"/> Vegetated component >5 acres						<input type="checkbox"/> Vegetated component 1-5 acres						<input type="checkbox"/> Vegetated component <1 acre					
B	<input checked="" type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low

P/P	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
S/I	.9H	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
T/E/A	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. **Discharge Indicators**

- Springs are known or observed.
- Vegetation growing during dormant season/drought.
- Wetland occurs at the toe of a natural slope.
- Seeps are present at the wetland edge.
- AA permanently flooded during drought periods.
- Wetland contains an outlet, but no inlet.
- Other _____

ii. **Recharge Indicators**

- Permeable substrate presents without underlying impeding layer.
- Wetland contains inlet but not outlet.
- Other _____

iii. **Rating:** Use the information from 14J(i) and 14J(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: _____

14K. UNIQUENESS

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP. Jocko Spring Creek

PBS&J / MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: **Jocko Spring Creek** Project Number: **4300881**
Assessment Date: **July 31, 2009** Person(s) conducting the assessment: **G. Howard**
Location: **Arlee** MDT District: **Missoula** Milepost: _____
Legal Description: T **17N** R **20W** Section **16**
Weather Conditions: **Sunny, Temps in low 80's** Time of Day: **12-4**
Initial Evaluation Date: **August 11, 2008** Monitoring Year: **3** # Visits in Year: **1**
Size of evaluation area: **3 acres** Land use surrounding wetland: **highway, railroad, agriculture**

HYDROLOGY

Surface Water Source: **Jocko Spring Creek**
Inundation: **Present** Average Depth: **0.3 feet** Range of Depths: **0 -0.5**
Percent of assessment area under inundation: **60%**
Depth at emergent vegetation-open water boundary: **2 feet**
If assessment area is not inundated then are the soils saturated within 12 inches of surface: **_**
Other evidence of hydrology on the site (ex. – drift lines, erosion, stained vegetation, etc.):

Groundwater Monitoring Wells: **Absent**
Record depth of water below ground surface (in feet):

Well Number	Depth	Well Number	Depth	Well Number	Depth

- Additional Activities Checklist:
- Map emergent vegetation-open water boundary on aerial photograph.
 - Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining, etc.)
 - Use GPS to survey groundwater monitoring well locations, if present.

COMMENTS / PROBLEMS:
Mitigation site consists of the constructed Jocko Spring Creek channel, adjacent wetlands, and upland vegetation restoration areas. The wetland areas of the mitigation site are dominated by emergent vegetation and small area of remnant scrub-shrub and forested areas. Hydrology source is the perennial Jocko Spring Creek. Wetlands inundated from overbank flow of the creek onto the adjacent wetland pads and high groundwater. Site conditions are similar to those observed during 2008.

<i>Impatiens ecalcarata</i>	3		
<i>Juncus ensifolius</i>	3		
<i>Juncus spp.</i>	3		
<i>Lactuca serriola</i>	1		
<i>Lepidium perfoliatum</i>	1,2		
<i>Lychnis alba</i>	1,2		

Comments / Problems: One new species was identified for 2009: *Elodea canadensis*.

PLANTED WOODY VEGETATION SURVIVAL

Plant Species	Number Originally Planted	Number Observed	Mortality Causes
ALNINC	605	48	Plantings looked healthy with vigorous growth for the season with few discolored leaves. Browse protection were intact and properly functioning within the wetlands area. Browse protection was removed for the upland planting area on the north side of the railroad tracks. Bebb willow and common snowberry had the highest counts. Plantings located within the wetland areas and along the fringe were inundated – plants receiving adequate hydrology.
CRADOU	388	11	
CORSTO	106	39	
POPTRI		2	
PRUAME	323	30	
RHAALN	42	4	
ROSWOO	85	11	
SALBEB	386	92	
SALLUT	193	16	
SAMRAC		3	
SYMALB	234	50	

Comments / Problems: Shrub planting survival data was collected along three (lengths varied) 2 meter wide belt transects that totaled approximately 0.15 acres (6,000 sq. ft.). Transects were established along the edges of the created and enhanced wetland mitigation areas on the south-side of railroad grade. Another transect was placed along the upland restoration area on the north side of railroad grade. During the 2009 monitoring, species survival was based on visual estimates and counts for each live species. The original plantings numbers as listed above were referenced from Wetland Plant Summary – Spring Creek Wetlands (Appendix G). Actual planting numbers and prescribed species may vary from the original plan. Post design changes for planting prescriptions were adjusted during the construction phase due to availability of seedlings. Overall survival ratings are considered high based on visual assessment. Plant growth was vigorous and looked healthy with few discolored leaves. Browse protection were intact and properly functioning within the wetland planting zones. Wetland planting sites were inundated and plantings receiving adequate hydrology. The browse protection was removed from the upland planting areas.

WILDLIFE

Birds

Were man-made nesting structures installed? **No**
 If yes, type of structure: _____ How many? _____
 Are the nesting structures being used? **NA**
 Do the nesting structures need repairs? _____

Mammals and Herptiles

Additional Activities Checklist:

Yes Macroinvertebrate Sampling (if required)

Comments / Problems: Macroinvertebrate sampling conducted at two locations.

PHOTOGRAPHS

Using a camera with a 50mm lens and color film take photographs of the following permanent reference points listed in the check list below. Record the direction of the photograph using a compass. When at the site for the first time, establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3 feet above ground. Survey the location with a resource grade GPS and mark the location on the aerial photograph.

Photograph Checklist:

- One photograph for each of the four cardinal directions surrounding the wetland.
- At least one photograph showing upland use surrounding the wetland. If more than one upland exists then take additional photographs.
- At least one photograph showing the buffer surrounding the wetland.
- One photograph from each end of the vegetation transect, showing the transect.

Location	Photograph Frame #	Photograph Description	Compass Reading (°)

PP9	1.0	View looking north.	0
PP9	1.1	View looking east.	90

Comments / Problems: Refer to photopage for a more detailed description of the photo points.

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points set at a 5 second recording rate. Record file numbers for site in designated GPS field notebook.

GPS Checklist:

- Jurisdictional wetland boundary.
- 4-6 landmarks that are recognizable on the aerial photograph.
- Start and End points of vegetation transect(s).
- Photograph reference points.
- Groundwater monitoring well locations.

Comments / Problems: _____

WETLAND DELINEATION

(attach COE delineation forms)

At each site conduct these checklist items:

- Delineate wetlands according to the 1987 Army COE manual.
- Delineate wetland – upland boundary onto aerial photograph.
- NA** Survey wetland – upland boundary with a resource grade GPS survey.

Comments / Problems: _____

FUNCTIONAL ASSESSMENT

(Complete and attach full MDT Montana Wetland Assessment Method field forms.)
(Also attach any completed abbreviated field forms, if used)

Comments / Problems: **FA completed using the 1999 MDT MWAM. Mitigation crediting system requires a pre- and post-project functional assessment that requires a direct comparison using the 1999 methods for functional shift.**

:

MAINTENANCE

Were man-made nesting structure installed at this site? **No**

If yes, do they need to be repaired? **NA**

If yes, describe the problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures built or installed to impound water or control water flow into or out of the wetland? **NA**

If yes, are the structures working properly and in good working order? **NA**

If no, describe the problems below.

Percent of perimeter developing wetland vegetation (excluding dam/berm structures): ____%

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at the point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 foot wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S _____
- Incidental habitat (list species) D S Bull trout
- No usable habitat D S _____

ii. **Rating** (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.)

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.3 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S Westslope Cutthroat
- Incidental habitat (list species) D S Bald Eagle
- No usable habitat D S _____

iii. **Rating** (Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.)

Highest Habitat Level:	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	.6 (M)	---	---	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14C. General Wildlife Habitat Rating

i. **Evidence of overall wildlife use in the AA:** (Check either substantial, moderate, or low)

- Substantial** (based on any of the following)
 - observations of abundant wildlife #s or high species diversity (during any period)
 - abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
 - presence of extremely limiting habitat features not available in the surrounding area
 - interviews with local biologists with knowledge of the AA
- Low** (based on any of the following)
 - few or no wildlife observations during peak use periods
 - little to no wildlife sign
 - sparse adjacent upland food sources
 - interviews with local biologists with knowledge of AA
- Moderate** (based on any of the following)
 - observations of scattered wildlife groups or individuals or relatively few species during peak periods
 - common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
 - adequate adjacent upland food sources
 - interviews with local biologists with knowledge of the AA

ii. **Wildlife Habitat Features** (Working from top to bottom, select appropriate AA attributes to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from #13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see #10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from #13)	<input checked="" type="checkbox"/> High								<input type="checkbox"/> Moderate								<input type="checkbox"/> Low			
Class Cover Distribution (all vegetated classes)	<input type="checkbox"/> Even				<input checked="" type="checkbox"/> Uneven				<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even			
Duration of Surface Water in ≥ 10% of AA	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Low disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see #12)	--	--	--	--	H	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
High disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. **Rating** (Using 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.)

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	--	--	--
Moderate	--	.7 (M)	--	--
Low	--	--	--	--

Comments: _____

14D. GENERAL FISH/AQUATIC HABITAT RATING NA (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.)

Duration of Surface Water in AA	<input checked="" type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	H	--	--	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

Y N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: E H M L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	.9 (H)	--	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: _____

14E. FLOOD ATTENUATION NA (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow.

If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input type="checkbox"/> <10, >2 acres			<input checked="" type="checkbox"/> ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains no outlet or restricted outlet	--	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	--	--	--	.1 (L)

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check)

Y N Comments: _____

14F. SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input type="checkbox"/> >5 acre feet			<input checked="" type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	--	--	--	.8 (H)	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL NA (proceed to 14H)

Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input checked="" type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
Evidence of flooding or ponding in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
AA contains no or restricted outlet	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	.9 (H)	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/Shoreline Stabilization NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input checked="" type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	1 (H)	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function. A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input type="checkbox"/> Vegetated component >5 acres						<input checked="" type="checkbox"/> Vegetated component 1-5 acres						<input type="checkbox"/> Vegetated component <1 acre

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. **Discharge Indicators**

- Springs are known or observed.
- Vegetation growing during dormant season/drought.
- Wetland occurs at the toe of a natural slope.
- Seeps are present at the wetland edge.
- AA permanently flooded during drought periods.
- Wetland contains an outlet, but no inlet.
- Other _____

ii. **Recharge Indicators**

- Permeable substrate presents without underlying impeding layer.
- Wetland contains inlet but not outlet.
- Other _____

iii. **Rating:** Use the information from 14J(i) and 14J(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: _____

14K. UNIQUENESS

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP.			AA does not contain previously cited rare types or associations and structural diversity (#13) is low-moderate.

Mission Creek

PBS&J / MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: Mission Creek Project Number: B4300882
 Assessment Date: July 23, 2009 Person(s) conducting the assessment: G. Howard
 Location: St. Ignatius MDT District: Missoula Milepost: _____
 Legal Description: T 16N R 20W Section 2
 Weather Conditions: Sunny, Temps in low 80's Time of Day: 12-4
 Initial Evaluation Date: July 23, 2009 Monitoring Year: 1 # Visits in Year: 2
 Size of evaluation area: > 1 acres Land use surrounding wetland: Agriculture

HYDROLOGY

Surface Water Source: Mission Creek
 Inundation: Absent Average Depth: _____ feet Range of Depths: _____
 Percent of assessment area under inundation: _____ %
 Depth at emergent vegetation-open water boundary: _____ feet
 If assessment area is not inundated then are the soils saturated within 12 inches of surface:
 Other evidence of hydrology on the site (ex. – drift lines, erosion, stained vegetation, etc.):
Ordinary high water mark

Groundwater Monitoring Wells: Absent
 Record depth of water below ground surface (in feet):

Well Number	Depth	Well Number	Depth	Well Number	Depth

- Additional Activities Checklist:
- Map emergent vegetation-open water boundary on aerial photograph.
 - Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining, etc.)
 - Use GPS to survey groundwater monitoring well locations, if present.

COMMENTS / PROBLEMS:

Mitigation site consists of restored channel and re-established floodplain along Mission Creek.
Mitigation efforts included the removal of the stream from 8 foot elliptical pipe, channel restoration, and vegetation enhancements within the restored floodplain. Woody plants installed within the floodplain are thriving and have new growth. Several noxious weed species identified including Canada Thistle (*Cirsium arvense*), oxeye daisy (*Chrysanthemum leucanthemum*) and yellow flag iris (*Iris pseudacorus*).

PLANTED WOODY VEGETATION SURVIVAL

Plant Species	Number Originally Planted	Number Observed	Mortality Causes
ALNINC		22	Plantings looked healthy with vigorous growth for the season with few discolored leaves. Thin-leaf alder and black cottonwood species had the highest counts along transect. Plantings were heavy browsed due to no browse protection. Many of the planted species had died back and re-sprouted new growth.
AMEALN		10	
BETOCC		1	
CORSTO		8	
CRADOU		18	
POPTRE		2	
POPTRI		47	
PRUVIR		13	
ROSWOO		16	
RUBIDA		2	
SALBEB		19	
SALEXI		10	
SALLUT		3	
SYMALB		9	

Comments / Problems: Shrub / tree planting survival data was collected along three separate areas at Mission Creek site. These included the southwest, southeast and northeast areas of the re-establishment zones. Zones were separated by channel and the new bridge. Each zone was established with several small transects. During the 2009 monitoring, species survival was based on visual estimates and counts for each live species. The original plantings numbers were referenced from Summary and Construction Notes. (Appendix G). Actual planting numbers and prescribed species may vary from the original plan. Overall survival ratings are considered high based on visual assessment.

WILDLIFE

Birds

Were man-made nesting structures installed? No

If yes, type of structure: _____ How many? _____

Are the nesting structures being used? NA

Do the nesting structures need repairs? _____

Mammals and Herptiles

Mammal and Herptile Species	Number Observed	Indirect Indication of Use			
		Tracks	Scat	Burrows	Other
Deer		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Additional Activities Checklist:

NA Macroinvertebrate Sampling (if required)

Comments / Problems: _____

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points set at a 5 second recording rate. Record file numbers for site in designated GPS field notebook.

GPS Checklist:

- Jurisdictional wetland boundary.
- 4-6 landmarks that are recognizable on the aerial photograph.
- Start and End points of vegetation transect(s).
- Photograph reference points.
- Groundwater monitoring well locations.

Comments / Problems: _____

WETLAND DELINEATION

(attach COE delineation forms)

At each site conduct these checklist items:

- Delineate wetlands according to the 1987 Army COE manual.
- Delineate wetland – upland boundary onto aerial photograph.
- Yes** Survey wetland – upland boundary with a resource grade GPS survey.

Comments / Problems: _____

FUNCTIONAL ASSESSMENT

(Complete and attach full MDT Montana Wetland Assessment Method field forms.)

(Also attach any completed abbreviated field forms, if used)

Comments / Problems: **FA completed using the 1999 MDT Montana Wetland Assessment Method. Mitigation crediting system requires a direct comparison between pre- and post-project functional assessment to evaluate mitigation site progress with a functional shift.**

MAINTENANCE

Were man-made nesting structure installed at this site? **NA**

If yes, do they need to be repaired? **NA**

If yes, describe the problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures built or installed to impound water or control water flow into or out of the wetland? **NA**

If yes, are the structures working properly and in good working order? **NA**

If no, describe the problems below.

Comments / Problems: _____

Indicator Class

+ = Obligate
- = Facultative/Wet
0 = Facultative

Source

P = Planted
V = Volunteer

Percent of perimeter developing wetland vegetation (excluding dam/berm structures): ____%

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at the point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 foot wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

Comments: No vegetation transects established at the site.

14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S Bull trout
- Secondary habitat (list species) D S _____
- Incidental habitat (list species) D S Grizzly bear
- No usable habitat D S _____

ii. **Rating** (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	1 (H)	---	---	---	---	---	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S West slope cutthroat
- Incidental habitat (list species) D S Bald eagle
- No usable habitat D S _____

iii. **Rating** (Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level:	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	.7 (M)	---	---	---	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14C. General Wildlife Habitat Rating

i. **Evidence of overall wildlife use in the AA:** (Check either substantial, moderate, or low)

- Substantial** (based on any of the following)
 - observations of abundant wildlife #s or high species diversity (during any period)
 - abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
 - presence of extremely limiting habitat features not available in the surrounding area
 - interviews with local biologists with knowledge of the AA
- Low** (based on any of the following)
 - few or no wildlife observations during peak use periods
 - little to no wildlife sign
 - sparse adjacent upland food sources
 - interviews with local biologists with knowledge of AA
- Moderate** (based on any of the following)
 - observations of scattered wildlife groups or individuals or relatively few species during peak periods
 - common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
 - adequate adjacent upland food sources
 - interviews with local biologists with knowledge of the AA

ii. **Wildlife Habitat Features** (Working from top to bottom, select appropriate AA attributes to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from #13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see #10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from #13)	<input checked="" type="checkbox"/> High								<input type="checkbox"/> Moderate								<input type="checkbox"/> Low			
Class Cover Distribution (all vegetated classes)	<input type="checkbox"/> Even				<input checked="" type="checkbox"/> Uneven				<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even			
Duration of Surface Water in ≥ 10% of AA	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Low disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see #12)	--	--	--	--	H	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
High disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. **Rating** (Using 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.)

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	.9 (H)	--	--
Moderate	--	--	--	--
Low	--	--	--	--

Comments: High wildlife use levels within Mission Creek Corridor.

14D. GENERAL FISH/AQUATIC HABITAT RATING NA (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.)

Duration of Surface Water in AA	<input checked="" type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	H	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

Y N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: E H M L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	.9 (H)	--	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: _____

14E. FLOOD ATTENUATION NA (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow.

If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input checked="" type="checkbox"/> <10, >2 acres			<input type="checkbox"/> ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains no outlet or restricted outlet	--	--	--	--	.7 (H)	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	--	--	--	--

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check)
 Y N Comments: _____

14F. SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input type="checkbox"/> >5 acre feet			<input checked="" type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	--	--	--	.8 (H)	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL NA (proceed to 14H)

Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input checked="" type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
Evidence of flooding or ponding in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
AA contains no or restricted outlet	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	.9 (H)	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/Shoreline Stabilization NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input checked="" type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	1 (H)	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function. A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input checked="" type="checkbox"/> Vegetated component >5 acres				<input type="checkbox"/> Vegetated component 1-5 acres				<input type="checkbox"/> Vegetated component <1 acre			
B	<input checked="" type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. **Discharge Indicators**

- Springs are known or observed.
- Vegetation growing during dormant season/drought.
- Wetland occurs at the toe of a natural slope.
- Seeps are present at the wetland edge.
- AA permanently flooded during drought periods.
- Wetland contains an outlet, but no inlet.
- Other _____

ii. **Recharge Indicators**

- Permeable substrate presents without underlying impeding layer.
- Wetland contains inlet but not outlet.
- Other _____

iii. **Rating:** Use the information from 14J(i) and 14J(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: _____

14K. UNIQUENESS

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP.			AA does not contain previously cited rare types or associations and structural diversity (#13) is low-moderate.

Mud Creek

PBS&J / MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: Mud Creek Project Number: B4300882
 Assessment Date: July 23, 2009 Person(s) conducting the assessment: G. Howard
 Location: Pablo MDT District: Missoula Milepost: _____
 Legal Description: T 21N R 20W Section 13
 Weather Conditions: Sunny, Temps in low 80's Time of Day: 12-4
 Initial Evaluation Date: July 23, 2009 Monitoring Year: 1 # Visits in Year: 2
 Size of evaluation area: 2.5 acres Land use surrounding wetland: Agriculture and residential

HYDROLOGY

Surface Water Source: Mud Creek
 Inundation: Present Average Depth: 1.5 feet Range of Depths: 0-3 ft.
 Percent of assessment area under inundation: 20%
 Depth at emergent vegetation-open water boundary: _____ feet
 If assessment area is not inundated then are the soils saturated within 12 inches of surface:
 Other evidence of hydrology on the site (ex. – drift lines, erosion, stained vegetation, etc.):

Groundwater Monitoring Wells: Absent
 Record depth of water below ground surface (in feet):

Well Number	Depth	Well Number	Depth	Well Number	Depth

- Additional Activities Checklist:
- Map emergent vegetation-open water boundary on aerial photograph.
 - Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining, etc.)
 - Use GPS to survey groundwater monitoring well locations, if present.

COMMENTS / PROBLEMS:

Mitigation site consists of emergent wetlands, restored Mud Creek, riparian areas and uplands. Mitigation efforts included vegetation enhancements and Mud Creek restoration. The emergent portions of mitigation area are thriving with the removal of grazing and increased hydrology. Areas adjacent and along the banks of Mud Creek planted with woody vegetation. The vegetated soils lifts and wetland sod matting used in creek restoration are thriving and well established with dense emergent vegetation cover along most of the creek banks. Several noxious weed species identified including Canada Thistle (*Cirsium arvense*) and oxeye daisy (*Chrysanthemum leucanthemum*).

Comments / Problems:

PLANTED WOODY VEGETATION SURVIVAL

Plant Species	Number Originally Planted	Number Observed	Mortality Causes
ALNINC	85	28	Plantings looked healthy with vigorous growth for the season with few discolored leaves. Thin-leaf alder and black cottonwood species had the highest counts along transect.
CORSTO	32	6	
CRADOU	10	5	
POPTRE	0	3	
POPTRI	83	28	
ROSWOO	31	8	
SALAMY	0	1	
SALBEB	56	10	
SALEXI	--	14	
SALLUT	54	4	

Comments / Problems: Shrub / tree planting survival data were collected along one (428 ft long) 2 meter wide belt transect that totaled approximately 0.06 acres (2,808 sq. ft.). Transect was established along the reconstructed creek and floodplain margins. During the 2009 monitoring, species survival was based on visual estimates and counts for each live species. The original plantings numbers as listed above were referenced from Wetland Mitigation Planting Details and Schedule (Appendix G). Actual planting numbers and prescribed species may vary from the original plan. Post design changes for planting prescriptions may have been adjusted during the construction phase due to availability of seedlings. Overall survival ratings are considered high based on visual assessment.

WILDLIFE

Birds

Were man-made nesting structures installed? **No**
 If yes, type of structure: _____ How many? _____
 Are the nesting structures being used? **NA**
 Do the nesting structures need repairs? _____

PHOTOGRAPHS

Using a camera with a 50mm lens and color film take photographs of the following permanent reference points listed in the check list below. Record the direction of the photograph using a compass. When at the site for the first time, establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3 feet above ground. Survey the location with a resource grade GPS and mark the location on the aerial photograph.

Photograph Checklist:

- One photograph for each of the four cardinal directions surrounding the wetland.
- At least one photograph showing upland use surrounding the wetland. If more than one upland exists then take additional photographs.
- At least one photograph showing the buffer surrounding the wetland.
- One photograph from each end of the vegetation transect, showing the transect.

Location	Photograph Frame #	Photograph Description	Compass Reading (°)
PP1	1.0	View looking east.	0
PP1	1.1	View looking northeast	45
PP2	1.0	View looking east.	90
PP2	1.1	View looking southeast.	135
PP3	1.0	View looking southwest.	225
PP4	1.0	View looking northwest.	315
PP5	1.0	View looking north.	0
PP6	1.0	View looking south.	180
PP6	1.1	View looking northeast.	45
PP7	1.0	View looking southeast.	135
PP8	1.0	View looking northwest.	315
PP8	1.1	View looking southeast.	135
PP9	1.0	View looking south.	180
PP9	1.1	View looking northwest.	315
PP10	1.0	View looking east.	90
PP11	1.0	View looking east.	90
PP12	1.0	View looking southwest.	225
PP13	1.0	View looking east.	90

Comments / Problems: Refer to the photopage for a more specific description of the photo points.

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points set at a 5 second recording rate. Record file numbers for site in designated GPS field notebook.

GPS Checklist:

- Jurisdictional wetland boundary.
- 4-6 landmarks that are recognizable on the aerial photograph.
- Start and End points of vegetation transect(s).
- Photograph reference points.
- Groundwater monitoring well locations.

Comments / Problems: _____

WETLAND DELINEATION

(attach COE delineation forms)

At each site conduct these checklist items:

- Delineate wetlands according to the 1987 Army COE manual.
- Delineate wetland – upland boundary onto aerial photograph.
- Yes** Survey wetland – upland boundary with a resource grade GPS survey.

Comments / Problems: _____

FUNCTIONAL ASSESSMENT

(Complete and attach full MDT Montana Wetland Assessment Method field forms.)

(Also attach any completed abbreviated field forms, if used)

Comments / Problems: **FA completed using the 1999 MDT Montana Wetland Assessment Method. Mitigation crediting system requires a direct comparison between pre- and post-project functional assessment to evaluate mitigation site progress with a functional shift.**

MAINTENANCE

Were man-made nesting structure installed at this site? **NA**

If yes, do they need to be repaired? **NA**

If yes, describe the problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures built or installed to impound water or control water flow into or out of the wetland? **NA**

If yes, are the structures working properly and in good working order? **NA**

If no, describe the problems below.

Comments / Problems: _____

MDT WETLAND MONITORING – VEGETATION TRANSECT

Cover Estimate

+ = < 1% 3 = 11-10%
1 = 1-5% 4 = 21-50%
2 = 6-10% 5 = > 50%

Indicator Class

+ = Obligate
- = Facultative/Wet
0 = Facultative

Source

P = Planted
V = Volunteer

Percent of perimeter developing wetland vegetation (excluding dam/berm structures): ____%

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at the point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 foot wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

Comments: _____

14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S _____
- Incidental habitat (list species) D S Grizzly bear
- No usable habitat D S _____

ii. **Rating** (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.3 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (list species) D S _____
- Secondary habitat (list species) D S _____
- Incidental habitat (list species) D S Bobolink
- No usable habitat D S _____

iii. **Rating** (Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level:	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.1 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14C. General Wildlife Habitat Rating

i. **Evidence of overall wildlife use in the AA:** (Check either substantial, moderate, or low)

Substantial (based on any of the following)

- observations of abundant wildlife #s or high species diversity (during any period)
- abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
- presence of extremely limiting habitat features not available in the surrounding area
- interviews with local biologists with knowledge of the AA

Low (based on any of the following)

- few or no wildlife observations during peak use periods
- little to no wildlife sign
- sparse adjacent upland food sources
- interviews with local biologists with knowledge of AA

Moderate (based on any of the following)

- observations of scattered wildlife groups or individuals or relatively few species during peak periods
- common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
- adequate adjacent upland food sources
- interviews with local biologists with knowledge of the AA

ii. **Wildlife Habitat Features** (Working from top to bottom, select appropriate AA attributes to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from #13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see #10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from #13)	<input checked="" type="checkbox"/> High								<input type="checkbox"/> Moderate								<input type="checkbox"/> Low			
Class Cover Distribution (all vegetated classes)	<input type="checkbox"/> Even				<input checked="" type="checkbox"/> Uneven				<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even			
Duration of Surface Water in ≥ 10% of AA	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Low disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see #12)	--	--	--	--	--	H	--	--	--	--	--	--	--	--	--	--	--	--	--	--
High disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. **Rating** (Using 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.)

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	--	--	--
Moderate	--	.7 (M)	--	--
Low	--	--	--	--

Comments: _____

14D. GENERAL FISH/AQUATIC HABITAT RATING NA (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.)

Duration of Surface Water in AA	<input checked="" type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	M	--	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

Y N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: E H M L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input type="checkbox"/> High	<input checked="" type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	--	.7 (M)	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: _____

14E. FLOOD ATTENUATION NA (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow.

If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input checked="" type="checkbox"/> <10, >2 acres			<input type="checkbox"/> ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains no outlet or restricted outlet	--	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	.4 (M)	--	--	--

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check)

Y N Comments: _____

14F. SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input type="checkbox"/> >5 acre feet			<input checked="" type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	--	--	--	.8 (H)	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL NA (proceed to 14H)

Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input checked="" type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
Evidence of flooding or ponding in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
AA contains no or restricted outlet	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	.9 (H)	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/Shoreline Stabilization NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input checked="" type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	1 (H)	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function. A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input type="checkbox"/> Vegetated component >5 acres						<input checked="" type="checkbox"/> Vegetated component 1-5 acres						<input type="checkbox"/> Vegetated component <1 acre					
B	<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input checked="" type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. **Discharge Indicators**

- Springs are known or observed.
- Vegetation growing during dormant season/drought.
- Wetland occurs at the toe of a natural slope.
- Seeps are present at the wetland edge.
- AA permanently flooded during drought periods.
- Wetland contains an outlet, but no inlet.
- Other _____

ii. **Recharge Indicators**

- Permeable substrate presents without underlying impeding layer.
- Wetland contains inlet but not outlet.
- Other _____

iii. **Rating:** Use the information from 14J(i) and 14J(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: _____

14K. UNIQUENESS

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP.			AA does not contain previously cited rare types or associations and structural diversity (#13) is low-moderate.

Peterson Property

PBS&J / MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: **Peterson** Project Number: **B4308802**
 Assessment Date: **August 16, 2009** Person(s) conducting the assessment: **G. Howard**
 Location: **St. Ignatius** MDT District: **Missoula** Milepost: _____
 Legal Description: T **19N** R **20W** Section **35**
 Weather Conditions: **Clear & temps in low 90's** Time of Day: **12-4**
 Initial Evaluation Date: **August 15, 2008** Monitoring Year: **2** # Visits in Year: **2**
 Size of evaluation area: **5-6 acres** Land use surrounding wetland: **Agriculture & residences**

HYDROLOGY

Surface Water Source: **Unnamed perennial creek**
 Inundation: **Present** Average Depth: **0.5. feet** Range of Depths: **0-1 ft.**
 Percent of assessment area under inundation: _____ %
 Depth at emergent vegetation-open water boundary: _____ **feet**
 If assessment area is not inundated then are the soils saturated within 12 inches of surface: _____
 Other evidence of hydrology on the site (ex. – drift lines, erosion, stained vegetation, etc.): _____

Groundwater Monitoring Wells: **Absent**
 Record depth of water below ground surface (in feet):

Well Number	Depth	Well Number	Depth	Well Number	Depth

- Additional Activities Checklist:
- Map emergent vegetation-open water boundary on aerial photograph.
 - Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining, etc.)
 - Use GPS to survey groundwater monitoring well locations, if present.

COMMENTS / PROBLEMS:

Mitigation site consists of a long draw running east to west with hydrology source from unnamed drainage or tributary to Post Creek. Site dominated by emergent vegetation. Mitigation efforts implemented include the construction of log crib structures to impound water, and shrub and herbaceous plug plantings. Wetland areas inundated with shallow water. Site conditions similar to those observed in 2008. Additional observations for 2009 include a decrease in biomass cover for reed canarygrass (Phalaris arundinacea) and notes for crib structures. Reed canarygrass seemed under-developed with much less stem /leaf material as compared to previous years observation. This may be due to increased hydrology and extended spring / summer flooding. Crib structure near transect 2 has water draining over the dike on the north side of structure.

Comments / Problems: Four new species indentified during 2009 including *Cynoglossum officinale*, *Dianthus spp.*, *Elodea spp.*, and *Solanum dulcamara*.

PLANTED WOODY VEGETATION SURVIVAL

Plant Species	Number Originally Planted	Number Observed	Mortality Causes
ALNINC	1,163	27	Plantings looked healthy with moderate to vigorous growth for the season with few discolored leaves. Browse protection were intact and properly functioning. Some of the planted seedlings were installed higher than recommended. The base of the main caliper (stem) and associated roots were sticking out of the ground instead of flush with the ground. Thinleaf alder and woods rose had the highest counts.
CORSTO	226	14	
CRADOU	75	8	
PRUAME	226	9	
RHAALN	207	0	
ROSWOO	450	47	
SASLBEB	394	6	
SALEXI	--	6	
SALLUT	375	3	
SAMCER	19	0	
SYMALB	56	3	

Comments / Problems: Shrub planting survival data were collected along several (lengths varied) 2 meter wide belt transects that totaled approximately 0.17 acres (7,500 sq. ft.). Transects were established along the edges of the wetland draw encompassing creation and enhancement mitigation areas. One transect was placed along a log crib structure. During the 2009 monitoring, species survival was based on visual estimates and counts for each live species. The original plantings numbers as listed above were referenced from Peterson Tract Wetland Mitigation Site –Planting Summary (**Appendix G**). Actual planting numbers and prescribed species may vary from the original plan. One species (*Salix exigua*) was found that was not listed in the original planting summary. Post design changes for planting prescriptions may have been adjusted during the construction phase due to availability of seedlings. Overall survival ratings are considered moderate to high based on visual assessment. Plant growth was vigorous and looked healthy with few discolored leaves. Browse protection were intact and properly functioning.

WILDLIFE

Birds

Were man-made nesting structures installed? **No**
If yes, type of structure: _____ How many? _____
Are the nesting structures being used? **NA**
Do the nesting structures need repairs? _____

Mammals and Herptiles

Mammal and Herptile Species	Number Observed	Indirect Indication of Use			
		Tracks	Scat	Burrows	Other
Deer		<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	
Muskrat		<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	
Raccoon		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
Crayfish	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	

Additional Activities Checklist:

NA Macroinvertebrate Sampling (if required)

Comments / Problems: _____

GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points set at a 5 second recording rate. Record file numbers for site in designated GPS field notebook.

GPS Checklist:

- Jurisdictional wetland boundary.
- 4-6 landmarks that are recognizable on the aerial photograph.
- Start and End points of vegetation transect(s).
- Photograph reference points.
- Groundwater monitoring well locations.

Comments / Problems: _____

WETLAND DELINEATION

(attach COE delineation forms)

At each site conduct these checklist items:

- Delineate wetlands according to the 1987 Army COE manual.
- Delineate wetland – upland boundary onto aerial photograph.
- NA** Survey wetland – upland boundary with a resource grade GPS survey.

Comments / Problems: _____

FUNCTIONAL ASSESSMENT

(Complete and attach full MDT Montana Wetland Assessment Method field forms.)
(Also attach any completed abbreviated field forms, if used)

Comments / Problems: **Functional Assessment completed in 2008 using the 1999 MDT Montana Wetland Assessment Method. The mitigation credit system requires a pre-and post-project functional assessment using the 1999 methods for a direct comparison of scores to show functional shift at the mitigation site that determines enhancement ratio to be applied.**

MAINTENANCE

Were man-made nesting structure installed at this site? **NA**

If yes, do they need to be repaired? **NA**

If yes, describe the problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures built or installed to impound water or control water flow into or out of the wetland? **Yes**

If yes, are the structures working properly and in good working order? **Yes**

If no, describe the problems below.

Comments / Problems: **General inspection of log crib structures. Log cribs generally working correctly with induration above the crib and surface flow through crib spill over. However, undercutting and substantive leakage between logs was observed, and during 2009, surface water was draining over top of the crib dike near Transect 2.**

Source

P = Planted
V = Volunteer

Percent of perimeter developing wetland vegetation (excluding dam/berm structures): **100%**

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at the point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 foot wide "belt" along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

Comments: _____

14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (**list species**) D S _____
- Secondary habitat (**list species**) D S _____
- Incidental habitat (**list species**) D S Grizzly bear
- No usable habitat D S _____

ii. **Rating** (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.3 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

- Primary or Critical habitat (**list species**) D S _____
- Secondary habitat (**list species**) D S _____
- Incidental habitat (**list species**) D S Black tern, Bald Eagle,
- No usable habitat D S _____

iii. **Rating** (Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level:	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point and Rating	---	---	---	---	---	.1 (L)	---

If documented, list the source (e.g., observations, records, etc.): Montana Natural Heritage Program.

14C. General Wildlife Habitat Rating

i. **Evidence of overall wildlife use in the AA:** (Check either substantial, moderate, or low)

Substantial (based on any of the following)

- observations of abundant wildlife #s or high species diversity (during any period)
- abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
- presence of extremely limiting habitat features not available in the surrounding area
- interviews with local biologists with knowledge of the AA

Low (based on any of the following)

- few or no wildlife observations during peak use periods
- little to no wildlife sign
- sparse adjacent upland food sources
- interviews with local biologists with knowledge of AA

Moderate (based on any of the following)

- observations of scattered wildlife groups or individuals or relatively few species during peak periods
- common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
- adequate adjacent upland food sources
- interviews with local biologists with knowledge of the AA

ii. **Wildlife Habitat Features** (Working from top to bottom, select appropriate AA attributes to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from #13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see #10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from #13)	<input type="checkbox"/> High								<input checked="" type="checkbox"/> Moderate								<input type="checkbox"/> Low			
Class Cover Distribution (all vegetated classes)	<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even				<input checked="" type="checkbox"/> Uneven				<input type="checkbox"/> Even			
Duration of Surface Water in ≥ 10% of AA	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Low disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	H	--	--	--	--	--	--	--
High disturbance at AA (see #12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. **Rating** (Using 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.)

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	--	--	--
Moderate	--	.7 (M)	--	--
Low	--	--	--	--

Comments: _____

14D. GENERAL FISH/AQUATIC HABITAT RATING NA (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat, excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

i. **Habitat Quality** (Pick the appropriate AA attributes in matrix to pick the exceptional (E), high (H), moderate (M), or low (L) quality rating.)

Duration of Surface Water in AA	<input type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
Cover - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--

ii. **Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

Y N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: E H M L

iii. **Rating** (Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to pick the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).)

Types of Fish Known or Suspected Within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	--	--	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: _____

14E. FLOOD ATTENUATION NA (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow.

If wetlands in AA do not flooded from in-channel or overbank flow, check NA above.

i. **Rating** (Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input checked="" type="checkbox"/> <10, >2 acres			<input type="checkbox"/> ≤2 acres		
% of flooded wetland classified as forested, scrub/shrub, or both	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
AA contains no outlet or restricted outlet	--	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	.4 (M)	--	--	--

ii. **Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA?** (check)

Y N Comments: _____

14F. SHORT AND LONG TERM SURFACE WATER STORAGE NA (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Abbreviations: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input type="checkbox"/> >5 acre feet			<input checked="" type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
Duration of surface water at wetlands within the AA	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Wetlands in AA flood or pond ≥ 5 out of 10 years	--	--	--	.8 (H)	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: _____

14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL NA (proceed to 14H)

Applies to wetlands with potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.)

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input checked="" type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
Evidence of flooding or ponding in AA	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No	
AA contains no or restricted outlet	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	.9 (H)	--	--	--	--	--	--	--

Comments: _____

14H. SEDIMENT/Shoreline Stabilization NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, check NA above.

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input checked="" type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	1 (H)	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: _____

14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function. A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet; P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input type="checkbox"/> Vegetated component >5 acres						<input checked="" type="checkbox"/> Vegetated component 1-5 acres						<input type="checkbox"/> Vegetated component <1 acre					
B	<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input type="checkbox"/> High		<input checked="" type="checkbox"/> Moderate		<input type="checkbox"/> Low		<input type="checkbox"/> High		<input type="checkbox"/> Moderate		<input type="checkbox"/> Low

Comments: _____

14J. GROUNDWATER DISCHARGE/RECHARGE (D/R) (Check the indicators in i & ii below that apply to the AA)

i. **Discharge Indicators**

- Springs are known or observed.
- Vegetation growing during dormant season/drought.
- Wetland occurs at the toe of a natural slope.
- Seeps are present at the wetland edge.
- AA permanently flooded during drought periods.
- Wetland contains an outlet, but no inlet.
- Other _____

ii. **Recharge Indicators**

- Permeable substrate presents without underlying impeding layer.
- Wetland contains inlet but not outlet.
- Other _____

iii. **Rating:** Use the information from 14J(i) and 14J(ii) above and the table below to arrive at the functional point and rating of high (H) or low (L) for this function.

Criteria	Functional Point and Rating
AA has known Discharge/Recharge area or one or more indicators of D/R present	1 (H)
No Discharge/Recharge indicators present	--
Available Discharge/Recharge information inadequate to rate AA D/R potential	--

Comments: _____

14K. UNIQUENESS

i. **Rating** (Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Replacement Potential	AA contains fen, bog, warm springs or mature (>80 yr-old) forested wetland or plant association listed as "S1" by the MTNHP.			AA does not contain previously cited rare types and structural diversity (#13) is high or contains plant association listed as "S2" by the MTNHP. 2009 REPRESENTATIVE PHOTOGRAPHS

US Highway 93 Onsite: Bouchard, Jocko Spring Creek, Mission Creek, Mud Creek, and Peterson Property

BOUCHARD PROPERTY MITIGATION SITE 2009

Photo Point No. 1: View facing north along vegetation Transect # 1. Upland vegetation transitioning into created wetlands (Type 2).

Photo Point No. 2: View facing north towards the end of Transect # 1.

Photo Point No. 5: View facing east along Transect # 2 at scrub-shrub and emergent wetlands.

Photo Point No. 7: View facing east at the end of Transect # 2 and eastern side of parcel.

Photo Point No. 7: View facing west along Transect # 2 at emergent and scrub-shrub vegetation types with the wetland.

Photo Point No. 9: View facing southwest at the start of Transect # 3. Shallow open-water located in background and weedy vegetation around the fringe.

BOUCHARD PROPERTY MITIGATION SITE 2009

Photo Point No. 9: View facing northwest along the fringe of the ponds. Area dominated by weedy / aggressive species.

Photo Point No. 9: View facing northeast along Transect # 3. Area dominated by emergent vegetation type.

Photo Point No. 9: View facing southeast along the weedy fringe of ponds. Area dominated by musk thistle a weedy species.

Photo Point No. 11: View facing northwest across the shallow open-water pond.

BOUCHARD PROPERTY MITIGATION SITE 2009

Photo Point No. 3: View facing west across the transition between the wetland creation (Type 2 and 3) and the existing rehabilitation areas (Type 5).

Photo Point No. 3: Panoramic view facing south across the wetland creation areas (Type 2, and 3).

BOUCHARD PROPERTY MITIGATION SITE 2009

Photo Point No. 4: View facing south along a shallow open-water pond and adjacent emergent vegetation types. Community Type 6 in the background with areas dominated by scrub-shrub vegetation types.

Photo Point No.5: View facing north across wetland transition between emergent (Type 5) and scrub-shrub (Type 6) vegetation types.

BOUCHARD PROPERTY MITIGATION SITE 2009

Photo Point No. 6: View facing southeast along another wetland transition zone between upland (Type 1) and emergent vegetation type (Type 5). Wetland areas considered mitigation type wetland rehabilitation.

Photo Point No. 8: View facing north from the southeast corner of the parcel. Spring creek runs adjacent to parcel along boundary. This area was previously an inlet to the Bouchard Property for irrigation waters. Inlet plugged and ditches filled as part of the mitigation efforts.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 1: View looking southeast along the route of the old Jocko Spring Creek channel. Old channel filled and site planted with upland / riparian species.

Photo Point No. 2: View looking southeast at the start of Transect # 1.

Photo Point No. 2: View looking northwest at mitigation boundary. Vegetation transition between upland and wetland areas.

Photo Point No. 2: View looking southwest at adjacent parcel. Site dominated by weedy species.

Photo Point No. 3: View looking southeast along Transect # 2 where it crosses the channel. Wetlands dominated by emergent vegetation.

Photo Point No.3: View looking northwest along Transect # 2. Area dominated by emergent vegetation type.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 4: View looking southeast along Transect # 2 from the other side of the channel.

Photo Point No. 4: View looking northwest across channel back towards the start of the Transect # 2.

Photo Point No. 5: View looking south across mitigation site.

Photo Point No. 5: View looking northwest along Transect # 2 from the end point.

Photo Point No. 6: View looking northeast along Transect # 1. Area dominated by emergent vegetation type and shrub plantings.

Photo Point No. 6: View looking north along the mitigation boundary. Shrub plantings seen in the foreground.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 7: View looking southwest along Transect # 1 towards starting point and across channel.

Photo Point No. 7: View looking northeast at Transect # 1 ending point.

Photo Point No. 7: View looking southeast along channel towards southeast end of the project site.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 2: View looking northwest across mitigation site. View showing transition between upland and emergent wetland areas. Shrub planting throughout the area.

Photo Point No. 3: Panoramic view looking southeast across channel and emergent vegetation types.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 7: View looking northwest along channel and adjacent emergent vegetation types.

Photo Point No.8: View looking northwest along mitigation site and adjacent railroad grade. Areas to the left of the view consist of created and enhanced wetlands. Shrub plantings along the outer fringe of the mitigation site.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 8: View looking southwest across mitigation site towards newly constructed channel, emergent vegetation type and shrub plantings along the outer fringe.

Photo Point No. 8: View looking southeast across the southern end of the mitigation site. Remnant cattail and small stand of black cottonwood within the mitigation area.

Photo Point No. 9: View looking north across mitigation areas on the north side of the railroad grade at emergent wetlands and upland shrub plantings.

JOCKO SPRING CREEK MITIGATION SITE 2009

Photo Point No. 9: View looking southeast across newly constructed channel, and scrub-shrub and emergent vegetation types.

MISSION CREEK WETLAND MITIGATION SITE 2009

Photo Point 1: View looking southwest across the mitigation site from east side of the highway. Area consists of re-established floodplain of Mission Creek. Mitigation efforts included vegetation enhancement with the planting of woody riparian / wetland species.

Photo Point 1: View looking west across the east side of the site along the restored Mission Creek and adjacent floodplain.

MISSION CREEK WETLAND MITIGATION SITE 2009

Photo Point 2: View looking southwest along the west side of mitigation site. Area planted with woody vegetation.

Photo Point 2: View looking east under the bridge across the site along the restored channel and floodplain.

MISSION CREEK WETLAND MITIGATION SITE 2009

Photo Point 3: View looking north along emergent wetlands along the restored channel banks. Vegetation dominated by sedges and manna grass.

Photo Point 4: View looking north across the mitigation site on the west side of the highway.

MISSION CREEK WETLAND MITIGATION SITE 2009

Photo Point 5: View looking south across the west side of the mitigation site. Note stream gage on far bank.

Photo Point 5: View looking north along the western side of the mitigation area.

MUD CREEK MITIGATION SITE 2009

Photo Point 1: View looking east across the mitigation site near the southern end.

Photo Point 1: View looking northeast across the site at C.T. 1 dominated Baltic rush.

MUD CREEK MITIGATION SITE 2009

Photo Point 2: View looking east along the northern boundary of the mitigation site. Area dominated by emergent vegetation type.

Photo Point 2: View looking south along the start of Transect #1.

MUD CREEK MITIGATION SITE 2009

Photo Point 3: View looking southwest across the site. Emergent vegetation type in the foreground.

Photo Point 4: View looking northwest at the end of Transect # 1.

MUD CREEK MITIGATION SITE 2009

Photo Point 5: Panoramic view looking north across the Mud Creek site. Site consists of emergent vegetation type and reconstructed Mud Creek.

Photo Point 6: View looking south towards the southern boundary of Mud Creek site.

Photo Point 6: View looking northeast along Mud Creek.

MUD CREEK MITIGATION SITE 2009

Photo Point 7: View looking southeast at the end of Transect # 1 near the fence boundary in the background view.

Photo Point 8: View looking northwest along Transect # 1. Photo view of C.T. 3 dominated by small-fruited bulrush.

Photo Point 8: View looking southeast along Transect # 1 toward Mud Creek.

Photo Point 9: View looking northwest along Transect # 1.

MUD CREEK MITIGATION SITE 2009

Photo Point 9: View looking south along Transect # 1 near Mud Creek.

Photo Point 10: View looking east along Mud Creek. Photo view shows an example of the restoration of the Mud Creek. Mud Creek banks were constructed with soil lifts utilizing vegetated coir consisting of sedges, mannagrass, rush and planted woody species.

MUD CREEK MITIGATION SITE 2009

Photo Point 11: View looking east along the Mud Creek as it flows under the new bridge structure.

Photo Point 12: View looking southwest along the reconstructed Mud Creek and adjacent floodplains. Area beyond the floodplain are considered upland and dominated by mostly aggressive weed y species. Area has been planted with riparian species.

MUD CREEK MITIGATION SITE 2009

Photo Point 13: View looking east towards the adjacent parcel along Mud Creek before it enters the mitigation site.

PETERSON WETLAND MITIGATION SITE 2009

Photo Point 1: View looking southwest along Transect # 1. Wetland area dominated by emergent vegetation type. Foreground view shows vegetation transition between upland to wetland.

Photo Point 2: View looking northeast along of Transect # 1 and across the mitigation site.

Photo Point 3 View looking northeast at the start of Transect # 1. Large rock represents the starting point.

PETERSON WETLAND MITIGATION SITE 2009

Photo Point 1: Panoramic view looking southwest across the mitigation site. Wetland site consists of draw dominated by emergent vegetation type. Unnamed tributary to Post Creek flows through the site. Mitigation efforts included reconstructing the channel and drainage.

Photo Point 2: View looking northeast across the site and along Transect # 1.

PETERSON WETLAND MITIGATION SITE 2009

Photo Point 2: View looking southeast along the wetland and upland boundary.

Photo Point 4: View looking north across the site western side of site or lower end of the project.

PETERSON WETLAND MITIGATION SITE 2009

Photo Point 5: View looking southeast at the end of Transect # 2. Vegetation transition between wetland and upland boundaries.

Photo Point 6: View looking north at the start of Transect # 2.

ORIGINAL SITE PLANS

*US Highway 93 Onsite: Bouchard, Jocko Spring Creek, Mission Creek,
Mud Creek, and Peterson Property*

STATE	PROJECT NUMBER	SHEET NO.
MONTANA	NH 5-24120120	L-3A

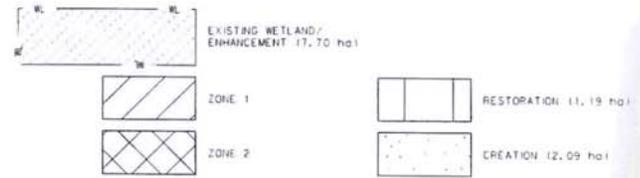

CSF - 0.99926000

DETAIL

- PLANTING NOTES:**
1. PLANT WOODY & HERBACEOUS MATERIAL IN THE SPECIFIC HYDROLOGIC REGIME LISTED IN THE PLANT LIST (PLANTING ZONES 1-3)
 2. USE 64 mm POT PERENNIAL HERBACEOUS PLANT MATERIAL IN WETLAND CREATION AREAS.
 3. USE NUMBER ONE CONTAINER SHRUB MATERIAL FOR WETLAND PLANTINGS, EXCEPT FOR THE WILLOW (SALIX) SPECIES.
 4. PLANT WILLOW (SALIX) SPECIES WITH 250 mm CYLINDER CONTAINER STOCK.
 5. INSTALL SPRING PLANTED PERENNIAL PLANTS AND SHRUBS NO LATER THAN APRIL 15.
 6. PLANT FALL PLANTED SHRUBS BETWEEN SEPTEMBER 15 AND OCTOBER 15.
 7. SEED BETWEEN OCTOBER 1 AND APRIL 15 PROVIDED THE GROUND IS NOT FROZEN.
 8. PLACE WOOD CHIP MULCH AROUND ALL #1 CONTAINER SHRUBS TO A DEPTH OF 150 mm AT THE SURFACE, 0.6 m IN DIAMETER, SURROUNDING THE BASE OF THE PLANT.
 9. SEED LIPLAND AREAS DISTURBED DURING WETLAND CONSTRUCTION IN THE WETLAND MITIGATION AREA WITH THE FESCUE PRAIRIE MIX DEVELOPED FOR HIGHWAY 93 ROADSIDE SEEDING.
 10. PLACE WETLAND CREATION SHRUBS AT 1.2 m ON CENTER, SEE WETLAND PLANTING DETAIL.
 11. APPLY SEED BY BROADCAST METHODS. RAKE OR HARROW THE SEED.
 12. PLACE WETLAND CREATION HERBACEOUS PLUGS AT 0.5 m ON CENTER.

- GENERAL NOTES:**
1. PRIOR TO CONSTRUCTION COMMENCING, CONDUCT A PRE-CONSTRUCTION MEETING ON THE SITE BETWEEN THE CONTRACTOR, PROJECT MANAGER, MDT STAFF WETLANDS SPECIALIST AND WETLANDS ECOLOGIST TO DISCUSS THE DESIGN INTENT OF THE WETLANDS.
 2. PLANT SCRUB/SHRUB, HERBACEOUS EMERGENT AND HERBACEOUS WET MEADOW SPECIES FOR WETLAND COMMUNITIES TO BE ESTABLISHED IN WETLAND CREATION AREAS.
 3. PLACE PLANT MATERIAL IN THE APPROPRIATE ZONE AS DESCRIBED IN THE PLANT TABULATION COLUMN "PLANTING ZONE".
 4. PLANT ZONES SHOWN ON THE PLANTING PLAN ARE APPROXIMATE AND MAY CHANGE BASED ON CONDITIONS AFTER FINAL GRADING.

BIRD SURVEY PROTOCOL GPS PROTOCOL

*US Highway 93 Onsite: Bouchard, Jocko Spring Creek, Mission Creek,
Mud Creek, and Peterson Property*

BIRD SURVEY PROTOCOL

This protocol was developed by the Montana Department of Transportation (MDT) to monitor bird use within their Wetland Mitigation Sites. Though each wetland mitigation site is vastly different, the bird survey data collection methods were standardized to order to increase repeatability. The protocol uses an "area search within a restricted time frame" to collect data on bird species, density, behavior, and habitat-type use.

Survey Area

Sites that can be entirely walked: Sites where the entire perimeter or area can be walked include, but are not limited to: small ponds, enhanced historic river channels, and wet meadows. If the wetland is not uncomfortably inundated, walk several meandering transects to sufficiently cover the wetland. Meandering transects can be used, even if a small portion of the area is inaccessible (e.g. cannot cross due to inundation). Use binoculars to identify the bird species, to count the number of individuals, and to identify their behavior and habitat type. Data can be recorded directly onto the bird survey form or into a field notebook. The number of meandering transects and their direction (or location) should be recorded in the field notebook and/or drawn onto the aerial photograph or topographic map. Meandering transects are not formal and should not be staked. Each site should be walked and surveyed to the fullest extent within the set time limit.

Sites than cannot be entirely walked: Sites where the entire perimeter or area cannot be walked include, but are not limited to: very large sites (i.e. perimeter of 2-3 miles), and large-bodied waters (i.e. reservoirs), where deep water habitat (> 6 feet) is close to shore. For large-bodied waters where only one area was graded to create or enhance the development of wetland, bird surveys should be walked along meandering transects within or around the graded area (see above.). For sites that cannot be walked, bird surveys should be conducted from many lookout posts, established at key vantage points. The general location of lookout posts should be recorded in the field notebook or drawn onto the aerial photograph or topographic map. Lookout post locations do not need to be staked. Both binoculars and spotting scopes may be used in order to accurately identify and count the birds. Depending upon the size of the open water, more time may be spent viewing the mitigation area from lookout posts than is spent traveling between posts.

Survey Time

Ideally, bird surveys should be conducted in the morning hours when bird activity is often greatest (i.e. sunrise to no later than 11:00 am). Surveys can be completed before 11am if all transects have been walked or all lookout posts have been viewed with no new bird activity observed. For some sites bird surveys may need to be performed in the late afternoon or evening due to traveling constraints or weather. The overall limiting time factor will be the number of budgeted hours for the project.

Data Recording

Bird Species List: Record each bird species observed onto the Bird Survey-Field Data Sheet (or field notebook). Record the bird's common name using the appropriate 4-letter code. The 4-letter code uses the first two letters of the first two word's of the bird's common name or if one name, the first four letters. For example, Mourning Dove is coded as MODO while Mallard is coded as MALL. If an unknown individual is observed, use the 4-letter protocol, but define your

BIRD SURVEY PROTOCOL (continued)

abbreviation at the bottom of the field data sheet. For example, unknown shorebird is UNSB; unknown brown bird is UNBR; unknown warbler is UNWA; and unknown waterfowl is UNWF. For a flyover of a flock of unknown species, use a term that describes the birds' general characteristics and include the approximate flock size in parenthesis; do not fill in the habitat column. For example, a flock of black, medium-sized birds could be coded as UNBB / FO (25).

Bird Density: For each observation record the actual or estimated number of individuals observed per species and per behavior. Totals can be tallied in the office and entered onto the Bird Survey-Field Data Sheet.

Bird Behavior: Bird behavior must be identified by what is known. When a species is observed, the behavior that is immediately exhibited is recorded. Only behaviors that have discreet descriptive terms should be used. The following terms are recommended: breeding pair (BP); foraging (F); flyover (FO); loafing (L), which is defined as sleeping, roosting, or floating with head tucked under wing; and nesting (N). If other behaviors that have a specific descriptive word are observed then it can be used and should later be added to the protocol. Descriptive words or phrases such as "migrating" or "living on site" are unknown behaviors.

Bird Species Habitat Use: When a species is observed, the habitat is also recorded. The following broad habitat categories are used:

- ◆ aquatic bed (AB), defined as rooted-floating, floating-leaved, or submergent vegetation.
- ◆ marsh (MA), defined as emergent (e.g. cattail, bulrush) vegetation with surface water.
- ◆ wet meadow (WM), defined as grasses, sedges, or rushes with little to no surface water.
- ◆ scrub-shrub (SS), defined as shrub covered wetland.
- ◆ forested (FO), defined as tree covered wetland.
- ◆ open water (OW), defined as unvegetated surface water.
- ◆ upland (UP), defined as the upland buffer.

Other categories can be used and defined on the data sheet and should later be added to the protocol.

Other Fields

Bird Visit: Each bird survey (i.e. spring, fall, and mid-season) should be completed on separate Bird Survey-Field Data Sheets.

Time: Record the start time and end time on the Bird Survey-Field Data Sheet.

Date: Record the date of the bird survey.

Weather: Record the weather conditions (i.e. temperature, wind, condition).

Notes: Note if a particular individual bird is using a constructed nest box and note the condition of constructed nest box(es). Also record any comments about the site, wildlife, wetland conditions, etc.

GPS MAPPING AND AERIAL PHOTO REFERENCING PROCEDURE

From 2001 through 2006, PBS&J mapped the vegetation community boundaries, photograph points, and other sampling locations in the field using the resource-grade Trimble GEO III GPS (Global Positioning System) unit. The data were collected with a minimum of three positions per feature using Course/Acquisition code. The collected data were then transferred to a personal computer (PC) and differentially corrected to the nearest operating Community Base Station. The corrected data were then exported to ACAD drawings in Montana State Plain Coordinates NAD 83 international feet. The Trimble GEO III GPS unit was also used for some sites in 2007.

The collected and processed Trimble Geo III GPS positions had a 68% accuracy of 7 feet except in isolated areas where accuracy fell to 12 feet. This is within the 1 to 5 meter range listed as the expected accuracy of the mapping grade Trimble GPS.

In 2007 and 2008 sites were mapped using the resource-grade Magellan MobileMapper Office GPS unit. The Magellan GPS unit has a comparable accuracy level to the Trimble Geo III unit.

Each year, MDT photographs each mitigation site from the air. These aerial photographs are not geo-referenced, but serve as a visual aid to map wetland development and vegetation communities, and to show approximate locations for various monitoring activities (i.e. photograph points, transects, or macroinvertebrate sampling). Reference points that are observable on the aerial photo (i.e. road, stream channel, or fence) were also marked with the GPS unit in order to better position the aerial photograph. This positioning did not remove any of the distortion inherent to all photos. All mapped features and community boundaries were reviewed by the wetland biologist, to increase the figure's accuracy.

Any relationship of features located to easement or property lines are not to be construed from these figures. These relationships can only be determined with a survey by a licensed surveyor.

Appendix F

2009 MACROINVERTEBRATE SAMPLING PROTOCOL AND DATA

*US Highway 93 Onsite: Bouchard, Jocko Spring Creek, Mission Creek,
Mud Creek, and Peterson Property*

AQUATIC INVERTEBRATE SAMPLING PROTOCOL

Equipment List

- D-frame sampling net with 1 mm mesh.
- 1-liter, wide-mouth, plastic sample jars provided by Rhithron Associates, Inc. (Quart sized, wide-mouthed canning jars can be substituted.)
- 95% ethanol (alternatively isopropyl alcohol).
- Pre-printed sample labels (printed on rite-in-the-rain paper); two labels per sample.
- Pencil.
- Clear packaging tape.
- 3-5 gallon plastic pail.
- Large tea strainer or framed screen.
- Cooler with ice for storing sample.

Site Selection

Select a site that is accessible with hip waders or rubber boots. If the substrate is too soft, place a wide board down to walk on. Choose a site that is representative of the overall condition of the wetland. Annual sampling should occur at the same site within the wetland.

Sampling Procedure

Wetland invertebrates (macroinvertebrates) inhabit the substrate, the water column, the stems and leaves of aquatic vegetation, and the water surface. At the given location, each habitat type is sampled and combined into a single 1-liter sample jar. Pre-cautions are made to minimize disturbing the sample site in order to maximize the number of animals collected.

Fill the pail with approximately 1 gallon of wetland water. Ideally, sample the water column from near-shore outward to a depth of 3 feet. Sample the water column using a long sweep of the net, keeping the net at about half the depth of the water. Sample the water surface with a long sweep of the net. Aquatic vegetation is sampled by pulling the net beneath the water surface, for at least a meter in distance. The substrate is sampled by pulling the net along the bottom, bumping it against the substrate several times as you pull. Be sure to place some muck, mud, and/or vegetation into the jar. After sampling a habitat, rinse the net in the bucket and look for insects, crustaceans, and other aquatic invertebrates. It is not necessary to sample habitats in any specific order, but all habitats, if present, are to be sampled. Habitats can be sampled more than once.

Fill about 1 cup of ethanol into the sample jar. Sieve the contents of the bucket through the straining device and pour or carefully scrape the contents of the strainer into the sample jar. Top off the jar with enough ethanol to cover all the material and leave as little headroom as possible. Alternatively, sampled materials can be lifted out of the net and put directly into the jar. Be sure to include some muck, mud, and/or vegetation into the jar. Each macroinvertebrate sampling site should have only one sampling jar.

Using pencil, complete two labels with the required information: project name, project number, date, collector's name, and habitats sampled. Do not complete the label with ink as it will dissolve in ethanol. For wetlands with at least two macroinvertebrate sampling sites, number the site consecutively followed by the total number of sites (e.g. Sample 2 of 3 sites). Place one label into the jar and seal the jar. Dry the jar off, if necessary, and tape the second label to the outside of the jar.

Photograph each macroinvertebrate sampling site.

Sample Handling/Delivery

In the field, keep sample jars cool by placing in a cooler with a small amount of ice.

Deliver samples to the PBS&J office in Missoula, where they will be inventoried and delivered to Rhithron Associates, Inc.

**MDT Mitigated Wetland Monitoring Project: Aquatic Invertebrate Monitoring
Summary 2001 – 2009**

Prepared for Post, Buckley, Schuh, and Jernigan (PBS&J)
Prepared by W.Bollman, Rhithron Associates, Inc.

INTRODUCTION

This report summarizes data generated from eight years of mitigated wetland monitoring from sites throughout the State of Montana. A total of 229 invertebrate samples have been collected over the study period. Table 1 lists the currently monitored sites at which aquatic invertebrates were collected in 2009, and summarizes the sampling history of each.

METHODS

Sampling and Sample Processing

Aquatic invertebrate samples were collected at mitigated wetland sites in the summer months of 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, and 2009 by personnel of PBS&J. Sampling procedures were based on the protocols developed by the Montana Department of Environmental Quality (MDEQ) for wetland sampling. Sampling consisted of D-frame net sweeps through emergent vegetation (when present), the water column, and over the water surface, and included disturbing and scraping substrates at each sampled site. These sample components were composited and preserved in ethanol at each wetland site. Samples were delivered to Rhithron Associates, Inc. for processing, taxonomic determinations, and data analysis.

Standard sorting protocols were applied to achieve representative subsamples of a minimum of 100 organisms. Caton sub-sampling devices (Caton 1991), divided into 30 grids, each approximately 5 cm by 6 cm, were used. Grid contents were examined under stereoscopic microscopes using 10x-30x magnification. All aquatic invertebrates from each selected grid were sorted from the substrate, and placed in 95% ethanol for subsequent identification. Grid selection, examination, and sorting continued until at least 100 organisms were sorted. A large/rare search was conducted to collect any taxa not found in the subsampling procedure.

Organisms were individually examined using 10x – 80x stereoscopic dissecting scopes (Leica S8E and S6E) and identified to the lowest practical taxonomic levels using appropriate published taxonomic references. Identification, counts, life stages, and information about the condition of specimens were recorded on bench sheets. To obtain accuracy in richness measures, organisms that could not be identified to the target level specified in MDEQ protocols were designated as “not unique” if other specimens from the same group could be taken to target levels. Organisms designated as “unique” were those that could be definitively distinguished from other organisms in the sample. Identified organisms were preserved in 95% ethanol in labeled vials, and archived at the Rhithron laboratory. Midges were morphotyped using 10x – 80x stereoscopic dissecting microscopes (Leica S8E and S6E) and representative specimens were slide mounted and examined at 200x – 1000x magnification using an Olympus BX 51 compound microscope. Slide mounted organisms were also archived at the Rhithron laboratory.

Assessment

The method employed to assess these wetlands is based on an index incorporating a battery of 12 bioassessment metrics or attributes (Table 1) tested and recommended by Stribling et al. (1995) in a report to the Montana Department of Health and Environmental Science. In that study, it was determined that some of the metrics were of limited use in some geographic regions, and for some wetland types. Despite that finding, all 12 metrics are used in this evaluation of mitigated wetlands, since detailed geographic information and wetland classifications were unavailable for this report. Scoring criteria for the 12 metrics were developed specifically for this project, since mitigated wetlands were not included in original criteria development.

Scoring criteria for wetland metrics were developed by generally following the tactic used by Stribling et al. (1995). Boxplots were generated using a statistical software package (Statistica™), and distributions, median values, ranges, and quartiles for each metric were examined. For the wetland sites, “good” scores were generally

those that fell above the 75th percentile (for those metrics that decrease in value in response to stress) or below the 25th percentile (for metrics that respond to stress by an increase in value) of all scores. Additional scoring ranges were established by bisecting the range below the 75th percentile for decreasing scores (or above the 25th percentile for increasing scores) into “sub-optimal” and “poor” assessment categories. A score of 5, 3, or 1 was assigned to good, sub-optimal, and poor metric performance, respectively. In this way, metric values were translated into normalized metric scores, and scores for all metrics were summed to produce a total bioassessment score, which is expressed as a percentage of the maximum possible score (60). Total bioassessment scores were classified according to a similar process, using the ranges and distributions of total scores for all sites studied between 2001 and 2007. Data from a total of 167 sites were used to develop criteria.

Six sites in this study supported aquatic fauna characteristic of lotic habitats rather than lentic wetland habitats; these sites were excluded from mitigated wetland scoring criteria development, and were evaluated with a metric battery specific to flowing water habitats. In 2008, the lotic sites were Camp Creek (2 sites), Cloud Ranch stream, Jack Creek – McKee Spring, and Jocko Spring Creek (2 sites). Invertebrate assemblages at these sites were generally characteristic of montane or foothill stream conditions and were assessed using the tested metric battery developed for montane streams of Western Montana (MVFP index: Bollman 1998).

The purpose of constructing an index from biological attributes or metrics is to provide a means of integrating information to facilitate the determination of whether management action is needed. However, the nature of the action needed is not determined solely by the index score or impairment classification, but by consideration of an analysis of the component metrics, the taxonomic composition of the assemblages, and other issues. The diagnostic functions of the metrics and taxonomic data need more study since our understanding of the interrelationships of natural environmental factors and anthropogenic disturbances is tentative. Thus, the bioassessment index used in this report may not be universally applicable to all wetland types, and in particular, to constructed wetlands. Scores and impairment classifications derived from the index may not be valid indications of impairment or non-impairment. In addition, the further interpretive remarks accompanying the raw taxonomic and metric data in this summary are offered cautiously. Year-to-year comparisons depend on an assumption that specific sites were revisited in each year, and that equivalent sampling methods were utilized at each site revisit.

Bioassessment metrics - wetlands

An index based on the performance of 12 metrics was constructed, as described above. Table 2 lists those metrics, describes their calculation and the expected response of each to increased degradation or impairment of the wetland.

In addition to the summed scores of each metric and the associated impairment classification described above, each individual metric informs the bioassessment to some degree. The four richness metrics (Total taxa, POET, Chironomidae taxa, and Crustacea taxa + Mollusca taxa) can be interpreted to express habitat complexity as well as water quality. Complex, diverse habitats consist of variable substrates, emergent vegetation, variable water depths and other factors, and are potential features of long-established stable wetlands with minimal human disturbance. In the study conducted by Stribling et al. (1995), all four richness metrics were found to be significantly associated with water quality parameters including conductance, salinity, and total dissolved solids.

Four composition metrics (%Chironomidae, %Orthocladinae of Chironomidae, %Crustacea + %Mollusca, and %Amphipoda) measure the relative contributions of certain taxonomic groups that may have significant responses to habitat and/or water quality impacts. For example, amphipods have been demonstrated to increase in abundance in alkaline conditions. Short-lived, relatively mobile taxa such as chironomids dominate ephemeral environments; many are hemoglobin-bearers capable of tolerating de-oxygenated conditions.

Two tolerance metrics (Hilsenhoff Biotic Index [HBI] and %Dominant Taxon) were included in the bioassessment battery. The HBI indicates the overall invertebrate assemblage tolerance to nutrient enrichment, warm water, and/or low dissolved oxygen conditions. The percent abundance of the dominant taxon has been demonstrated to be strongly associated with pH, conductance, salinity, total organic carbon, and total dissolved solids.

Two trophic measures (%Collector-gatherers and %Filterers) may be helpful in expressing functional integrity of the invertebrate assemblage, which can be impacted by poor water quality or habitat degradation. High proportions of filtering organisms suggest nutrient and/or organic enrichment, while abundant collectors suggest more positive functional conditions and well-developed wetland morphology. These organisms graze periphyton growing on stable surfaces such as macrophytes.

Summary metric values and scores for the 2009 samples are given in Tables 4a-4c and 5. Thermal preference of invertebrate assemblages was calculated using Brandt 2001.

Bioassessment metrics – lotic habitats

For sites supporting rheophilic invertebrate assemblages, bioassessment was based on a metric battery and scoring criteria developed for montane regions of Montana (MVFP index: Bollman 1998). The six metrics constituting the bioassessment index used for MVFP sites in this study were selected because, both individually and as an integrated metric battery, they are robust at distinguishing impaired sites from relatively unimpaired sites (Bollman 1998). They have been demonstrated to be more variable with anthropogenic disturbance than with natural environmental gradients (Bollman 1998). Each of the six metrics and their expected responses to various stressors are described below.

1. Ephemeroptera (mayfly) taxa richness. The number of mayfly taxa declines as water quality diminishes. Impairments to water quality which have been demonstrated to adversely affect the ability of mayflies to flourish include elevated water temperatures, heavy metal contamination, increased turbidity, low or high pH, elevated specific conductance and toxic chemicals. Few mayfly species are able to tolerate certain disturbances to instream habitat, such as excessive sediment deposition.
2. Plecoptera (stonefly) taxa richness. Stoneflies are particularly susceptible to impairments that affect a stream on a reach-level scale, such as loss of riparian canopy, streambank instability, channelization, and alteration of morphological features such as pool frequency and function, riffle development and sinuosity. Just as all benthic organisms, they are also susceptible to smaller scale habitat loss, such as by sediment deposition, loss of interstitial spaces between substrate particles, or unstable substrate.
3. Trichoptera (caddisfly) taxa richness. Caddisfly taxa richness has been shown to decline when sediment deposition affects habitat. In addition, the presence of certain case-building caddisflies can indicate good retention of woody debris and lack of scouring flow conditions.
4. Number of sensitive taxa. Sensitive taxa are generally the first to disappear as anthropogenic disturbances increase. The list of sensitive taxa used here includes organisms sensitive to a wide range of disturbances, including warmer water temperatures, organic or nutrient pollution, toxic pollution, sediment deposition, substrate instability and others. Unimpaired streams of western Montana typically support at least four sensitive taxa (Bollman 1998).
5. Percent filter feeders. Filter-feeding organisms are a diverse group; they capture small particles of organic matter, or organically enriched sediment material, from the water column by means of a variety of adaptations, such as silken nets or hairy appendages. In forested montane streams, filterers are expected to occur in insignificant numbers. Their abundance increases when canopy cover is lost and when water temperatures increase and the accompanying growth of filamentous algae occurs. Some filtering organisms, specifically the Arctopsyche caddisflies (*Arctopsyche* spp. and *Parapsyche* spp.) build silken nets with large mesh sizes that capture small organisms such as chironomids and early-instar mayflies. Here they are considered predators, and, in this study, their abundance does not contribute to the percent filter feeders metric.
6. Percent tolerant taxa. Tolerant taxa are ubiquitous in stream sites, but when disturbance increases, their abundance increases proportionately. The list of taxa used here includes organisms tolerant of a wide range of disturbances, including warmer water temperatures, organic or nutrient pollution, toxic pollution, sediment deposition, substrate instability and others.

Table 1. Montana Department of Transportation Mitigated Wetlands Monitoring Project sites: sampling history. Only sites sampled in 2009 are included. An asterisk indicates lotic sites.

Table 2. Aquatic invertebrate metrics employed for wetland (lentic) invertebrate assemblages in the MDT mitigated wetlands study, 2001 – 2009.

Metric	Metric calculation	Expected response to degradation or impairment
Total taxa	Count of unique taxa identified to lowest recommended taxonomic level.	Decrease
POET	Count of unique Plecoptera, Trichoptera, Ephemeroptera, and Odonata taxa identified to lowest recommended taxonomic level.	Decrease
Chironomidae taxa	Count of unique midge taxa identified to lowest recommended taxonomic level.	Decrease
Crustacea taxa + Mollusca taxa	Count of unique Crustacea taxa and Mollusca taxa identified to lowest recommended taxonomic level.	Decrease
% Chironomidae	Percent abundance of midges in the subsample.	Increase
Orthoclaadiinae / Chironomidae	Number of individual midges in the sub-family Orthoclaadiinae / total number of midges in the subsample.	Decrease
% Amphipoda	Percent abundance of amphipods in the subsample.	Increase
% Crustacea + % Mollusca	Percent abundance of crustaceans in the subsample plus percent abundance of molluscs in the subsample.	Increase
HBI	Relative abundance of each taxon multiplied by that taxon’s modified Hilsenhoff Biotic Index (tolerance) value. These numbers are summed over all taxa in the subsample.	Increase
% Dominant taxon	Percent abundance of the most abundant taxon in the subsample.	Increase
% Collector-Gatherers	Percent abundance of organisms in the collector-gatherer functional group.	Decrease
% Filterers	Percent abundance of organisms in the filterer functional group.	Increase

RESULTS

(Note: Individual site discussions were removed from this report by PBS&J and are included in the macroinvertebrate sections of individual monitoring reports. Summary tables for lentic (4a – 4c) and lotic (5) sites and project specific taxa listing(s) and metrics report(s) are provided on the following pages.)

DETAIL

STATE	PROJECT NUMBER	SHEET NO.
MONTANA	MS 5-21(20)20	L-5
CSF - 0.99924000		

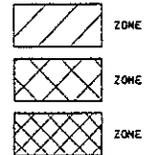

- PLANTING NOTES:**
1. PLANT WOODY & HERBACEOUS MATERIAL IN THE SPECIFIC HYDROLOGIC REGIME LISTED IN THE PLANT LIST (PLANTING ZONES 1-3)
 2. USE 64 mm POT PERENNIAL HERBACEOUS PLANT MATERIAL IN WETLAND CREATION AREAS. (ZONES 1 & 2)
 3. USE NUMBER ONE CONTAINER SHRUB MATERIAL FOR WETLAND PLANTINGS, EXCEPT FOR THE WILLOW (SALIX) SPECIES.
 4. PLANT WILLOW (SALIX) SPECIES WITH 250 mm CYLINDER CONTAINER STOCK.
 5. INSTALL SPRING PLANTED PERENNIAL PLANTS AND SHRUBS NO LATER THAN APRIL 15.
 6. PLANT FALL PLANTED SHRUBS BETWEEN SEPTEMBER 15 AND OCTOBER 15.
 7. SEED BETWEEN OCTOBER 1 AND APRIL 15 PROVIDED THE GROUND IS NOT FROZEN.
 8. PLACE WOOD CHIP MULCH AROUND ALL #1 CONTAINER SHRUBS TO A DEPTH OF 102 mm AT THE SURFACE, 0.6 m IN DIAMETER, SURROUNDING THE BASE OF THE PLANT.
 9. SEED UPLAND AREAS DISTURBED DURING WETLAND CONSTRUCTION IN THE WETLAND MITIGATION AREA WITH THE FESCUE PRAIRIE MIX DEVELOPED FOR HIGHWAY 93 ROADSIDE SEEDING.
 10. PLACE WETLAND CREATION SHRUBS AT 1.8 m ON CENTER. SEE WETLAND PLANTING DETAIL.
 11. APPLY SEED BY BROADCAST METHODS. RAKE OR HARRON THE SEED. SEED BERM REMOVAL AREAS WITH ZONE 2 SEED MIX.
 12. PLACE WETLAND CREATION HERBACEOUS PLUGS AT 1.0 m ON CENTER.

- GENERAL NOTES:**
1. PRIOR TO CONSTRUCTION COMMENCING, CONDUCT A PRE-CONSTRUCTION MEETING ON THE SITE BETWEEN THE CONTRACTOR, PROJECT MANAGER, NOT STAFF WETLANDS SPECIALIST AND WETLANDS ECOLOGIST TO DISCUSS THE DESIGN INTENT OF THE WETLANDS.
 2. PLANT SCRUB/SHRUB, HERBACEOUS EMERGENT AND HERBACEOUS WET MEADOW SPECIES FOR WETLAND COMMITMENTS TO BE ESTABLISHED IN WETLAND CREATION AREAS.
 3. PLACE PLANT MATERIAL IN THE APPROPRIATE ZONE AS DESCRIBED IN THE PLANT TABULATION COLUMN "PLANTING ZONE".
 4. PLANT ZONES SHOWN ON THE PLANTING PLAN ARE APPROXIMATE AND MAY CHANGE BASED ON CONDITIONS AFTER FINAL GRADING.

- CL - CL - PROPOSED GRADING BOUNDARY/CONSTRUCTION LIMITS

STATE	PROJECT NUMBER	SHEET NO.
MONTANA	NH-PLH 5-2142151	40

MUD CREEK WETLAND MITIGATION PLANTING NOTES

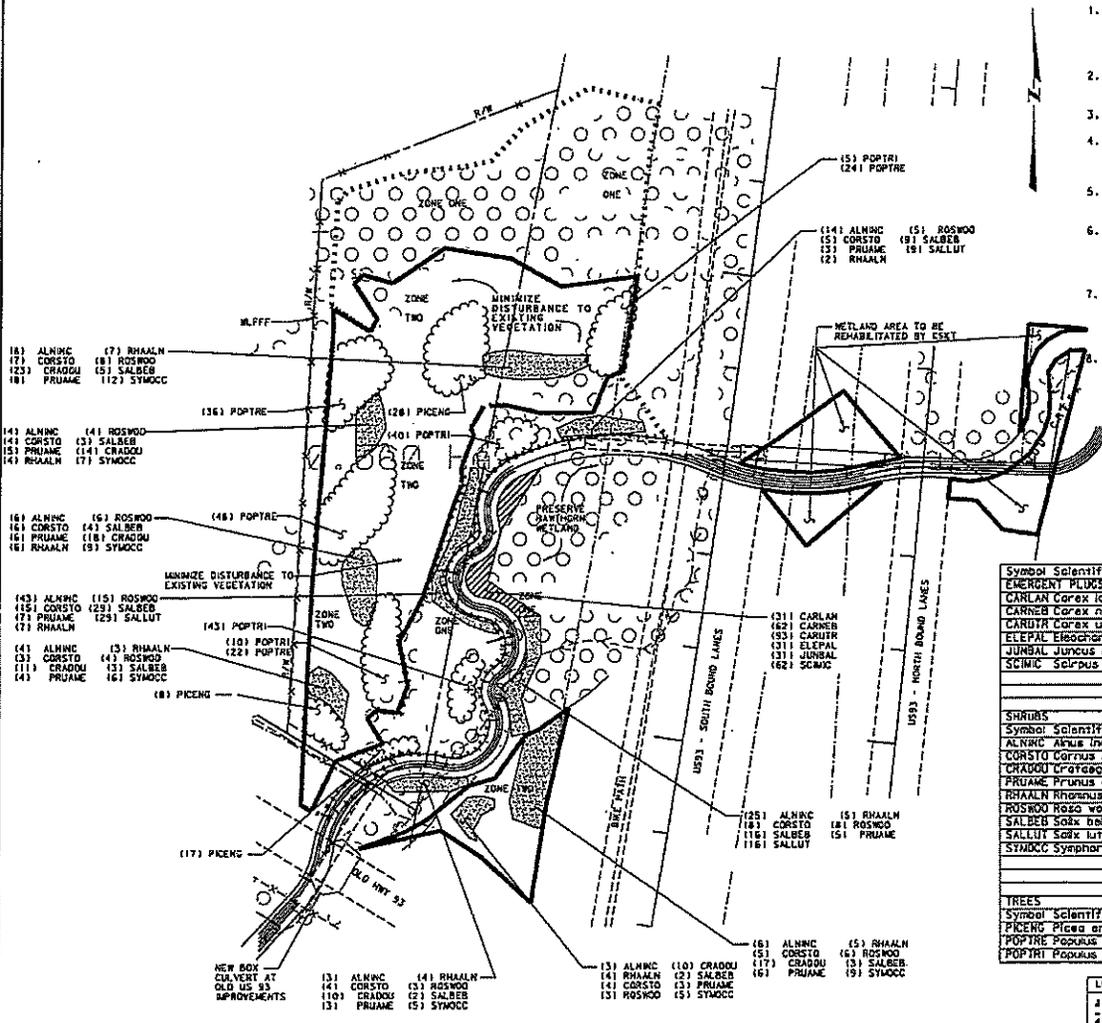

1. Sensitive Clearing Areas include Zone One and Zone Two and the relocated Mud Creek alignment. Clearing activities include removal of invasive species such as Yellow Iris and other vegetation or debris as designated by the Engineer and described in Project Weed Control Plan. See project-wide special provision for Subsection 108.03, Prosecution of Work.
2. Apply erosion control measures prior to construction of road, culvert or wetland mitigation as approved by Engineer.
3. Wildlife Fence - see detail and project-wide special provisions.
4. Protection/Sensitive Areas to include existing Hawthorne trees and other areas designated by Engineer. Fence areas with High Visibility Fence for Engineer approval prior to construction.
5. Limit grading activities and equipment to the new Mud Creek alignment and the section of existing Mud Creek to be abandoned.
6. Salvage and place wetland plants, wetland topsoil and riparian topsoil from the abandoned Mud Creek channel and impacted existing wetlands. Place wetland plants, wetland topsoil and riparian topsoil at new Mud Creek channel and in abandoned creek channel not filled by US 33 embankment. See Mud Creek Bank Protection Detail and Mud Creek Section for more information.
7. Seed areas within the Mud Creek wetland site disturbed by construction with Black Cottonwood Riparian Forest seed mix. Broad broadcast seed in areas with wet and saturated soils. It is estimated that seeding will be required for approximately 0.25 hectares of Zone One and 0.25 hectares of Zone Two. Engineer to approval disturbed areas to be seeded.
8. Plant locations are approximate. Contractor will stake location of plants for Engineer approval prior to planting.

NOTE:
 ZONE 1 IS PRIMARILY ENHANCING EXISTING WETLAND AREAS
 ZONE 2 IS PRIMARILY CREATING NEW WETLANDS IN EXISTING UPLAND AREAS

PETERSON TRACT WETLAND MITIGATION

General notes:

1. A NOT Project Manager must be on site prior to the commencement of grading and planting activities.
2. Conduct a survey under the direction of the Project Manager to establish planting and seeding areas log structure and basin locations.
3. Mitigation site work includes installation of log cribs, excavation, seeding and planting.
4. Install protection fencing prior to any construction activity. Construct temporary access road and stream crossing. Remove culvert, road and protection fencing following construction.
5. Minimize impact to existing wetlands through the use of established travelways and wetland crossings routes. Keep vehicles out of wetland areas except at log crib construction areas.
6. Sequence log crib construction down stream to upstream (west to east).

Grading Notes:

1. Prior to crib construction remove yellowflag iris, using a backhoe. Dispose in County woody debris disposal site as directed by the Project Manager. (Excavation estimated at 15 m³.)
2. Install twelve log cribs as shown on the plans of locations surveyed or identified by the Project Manager. Location should maximize ponding. Use multiple logs as necessary.
3. Wood material used for crib construction will be Douglas-Fir or Western Larch.
4. Excavate seven basins (approximately 20.7 m³) each as shown on the plans or identified by the Project Manager. Utilize excess material from basins on roadway, crib embankments, or crib backfill, as directed by Project Manager.

Planting Notes:

1. Planting will be done under the supervision of the Project Manager.
2. Seed disturbed areas with 0.05 kg. of fireweed (*epatulum angustifolium*).
3. Place Erosion Control Blanket as directed by the Project Manager.
4. Plant herbaceous plugs on grid 0.45 m (1.5 ft) on center in old disturbed areas.
5. Plant shrubs in clusters of the same species along existing wetland boundary as shown on plans.
6. Decompact soils to 85% of standard proctor and drill seed access route and staging area with Fescue Prairie Mix.

US Highway 93: Evaro to Polson
Compensatory Wetland Mitigation Crediting

Mr. Tom Parker
Herrera Environmental Consultants, Inc.
101 East Broadway, Suite 610
Missoula, Montana 59802

Dear Mr. Parker:

The purpose of this letter is to outline a compensatory wetland mitigation crediting scheme for the Montana Department of Transportation (MDT) Evaro – Polson US 93 project. The project is being split into at least nine separate segments for the purposes of design and construction, but the corridor was the subject of a single integrated Environmental Impact Statement.

1. Compensatory mitigation must be developed for all unavoidable, non-isolated aquatic impacts on the entire Evaro-Polson project. Unavoidable impacts and a compensatory mitigation package will be reviewed on a watershed and corridor basis for all design segments.
2. All compensatory mitigation sites recognized by the US Army Corps of Engineers (Corps) must be protected by a perpetual conservation easement or similar permanent land use restriction.
3. Use the methods in the 1987 Corps Wetland Delineation Manual to determine whether or not an area is a wetland.
4. All compensatory mitigation for the corridor should be within the limits of the watershed described by USGS Hydrologic Unit Code 17010212, Lower Flathead River, Montana.
5. All wetland impacts must be assessed using the 1999 MDT Montana Wetland Assessment Method.
6. Wetland compensatory mitigation ratios will be based on use of the 1999 MDT Montana Wetland Assessment Method to assign a functional score. The baseline (pre-project) mitigation site assessment score will be compared to the post-project rating, as described in your December 3, 2002 Draft Memorandum to this office. The basis for awarding credit will be the same for on- and off-site mitigation areas. While the crediting method presented was generally acceptable, a review of the proposal has resulted on the following limits on mitigation crediting:

7.1 **Creation:** The establishment of a wetland or other aquatic resource where one did not formerly exist. Creation of wetlands will result in a mitigation ratio of 1:1, with one acre of satisfactory wetland creation compensating for one acre of unavoidable wetland impact.

7.2 **Restoration:** Re-establishment of wetland and/or other aquatic resource characteristics and function(s) at a site where there were wetlands existed historically, but have been modified so that they are now considered non-wetland or exist in a substantially degraded state.

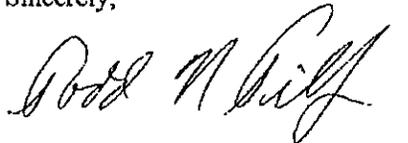

7.2.1 **Restoration (re-establishment)** of wetland characteristics to existing non-wetland areas that were historically wetlands will also result in a mitigation ratio of 1:1, with one acre of satisfactory wetland restoration of this type compensating for one acre of unavoidable wetland impact.

7.2.2 **Restoration (rehabilitation)** of wetland functions at existing wetland areas that exist in a substantially degraded state will result in a mitigation ratio of not less than 1½:1, with a minimum of one and a half acres of satisfactory wetland restoration of this type required to compensate for one acre of unavoidable wetland impact. For example, if the calculated crediting ratio for this type of site was calculated at 1.84:1, that is the ratio that would be used. If the calculation showed 1.34:1, the limit of 1½:1 would be used.

7.3 **Enhancement:** Altering the physical characteristics of an existing jurisdictional wetland such that it permanently modifies and improves one or more specific wetland functions with no corresponding decrease in any other functions. Examples include restoring normal hydrology to a partially drained wetland, or restoring a high level of species diversity to a monotypic plant community. Enhancement of existing wetland areas that are not substantially degraded will result in a mitigation ratio of not less than 3:1, with a minimum of three acres of satisfactory wetland enhancement of this type required to compensate for one acre of unavoidable wetland impact. For example, if the calculated crediting ratio for this type of site was calculated at 4.23:1, that is the ratio that would be used. If the calculation showed 2.23:1, the limit of 3:1 would be used.

This information is provided in response to our recent meeting and the December 3, 2002 Draft Memorandum on US 93 Wetland Mitigation Crediting provided by Herrera, Inc. Additional input from this office will be provided as necessary and as the plan for mitigation crediting matures. If you have questions feel free to call me at (406) 441-1375, and reference Corps File Number 2001-90-416.

Sincerely,

Todd N. Tillinger, P.E.
Project Manager

Memorandum

To U.S. Army Corps of Engineers, Helena Office
cc Montana Department of Transportation
From Tom Parker, Herrera Environmental Consultants
Date December 3, 2002
Subject US 93 Wetland Mitigation Crediting

Introduction

Compensatory wetland mitigation, as credited by the Army Corps of Engineers, is often evaluated based on area ratios of mitigated wetlands to impacted wetlands. *Mitigated wetlands* include all wetland areas that are created, enhanced or preserved to compensate for impacted wetlands. Created wetlands are often credited at a 1:1 ratio, while existing wetlands that are enhanced or preserved may be credited at ratios ranging from 3:1 to 10:1.

Many opportunities exist along the US 93 corridor to enhance existing wetlands using combinations of active re-vegetation, land management change, weed management and other restoration actions. Often, it is difficult to determine the appropriate wetland credit ratio that should be assigned for a given wetland enhancement project. A quantitative basis for calculating appropriate enhancement ratios would benefit all participants in the wetland regulatory process. We understand that the regulatory agency has final authority to determine wetland mitigation credits.

Proposed Approach

We propose using the MDT Wetland Functional Assessment Method (MDT 1999) as a tool to measure the projected shift in wetland functions and values based on wetland mitigation activities. This method, which was used to assess functions and values of impacted wetlands along the corridor, evaluates 12 wetland functions and values (Tables 1 and 2). Using the procedure documented in MDT (1999), a wetland specialist assigns scores of 0 or 0.1 (low) to 1.0 (high) to each of the 12 categories at a particular site. These scores are totaled, resulting in a functional score for the site.

An evaluator measures projected shift in wetland functions and values by first assessing existing conditions on the site, then estimating changes in scores that would occur as a result of mitigation activities, and finally calculating the difference between these scores.

The shift in wetland function at a mitigation site could then be used to determine a crediting ratio for enhancement projects. Using this approach, the process for calculating wetland mitigation credits at a given site would have two components. First, a wetland creation component, assuming a 1:1 ratio for created wetlands, would be equal to the number of created wetland acres at a mitigation site. This creation component could be expressed as:

$$A_{created} = \text{Created wetland acres} \quad (1)$$

Second, an enhancement component would be the number of existing wetland acres to be enhanced, multiplied by an enhancement factor. The enhancement factor represents the ratio of functional shift (the difference between pre-project functional score and projected post-project functional score) to the pre-project functional score. The enhancement factor can be expressed as:

$$\text{Enhancement factor} = \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) \quad (2)$$

where:

F_{post} = Projected post-mitigation project functional score

F_{pre} = Pre-project functional score

Note: The enhancement ratio is the inverse $\left(\frac{1}{\text{enhancement factor}}\right)$ of the enhancement factor. The enhancement ratio is the term most frequently used to discuss crediting ratios for wetland mitigation projects. For example, an enhancement factor of 0.25 would be equal to an enhancement ratio of 4:1. This means that four enhanced acres at a particular site would be worth one acre of credit to offset wetland acres impacted by the project.

The enhancement component of the equation can then be expressed as:

$$A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) \quad (3)$$

where:

$A_{existing}$ = Existing wetland acres to be enhanced

F_{post} = Projected post-mitigation project functional score

F_{pre} = Pre-project functional score

The following equation, which includes both a creation and enhancement component, can then be used to calculate wetland mitigation credits expressed as acres:

$$A_{\text{credited}} = A_{\text{created}} + A_{\text{existing}} \left(\frac{F_{\text{post}} - F_{\text{pre}}}{F_{\text{pre}}} \right) \quad (4)$$

where:

- A_{credited} = Wetland mitigation credits expressed as acres
- A_{created} = Wetland creation acres
- A_{existing} = Existing wetland acres to be enhanced
- F_{post} = Projected post-mitigation project functional score
- F_{pre} = Pre-project functional score

To demonstrate how these equations can be applied in the context of US 93 wetland mitigation, we have selected two proposed wetland mitigation sites as examples. The Bouchard property (Example 1) is a 40-acre parcel north of Arlee. The Ludwig property (Example 2) includes slightly less than 20 acres and is two miles north of St. Ignatius.

Example 1

The Bouchard property has been acquired recently by MDT. This site is near the headwaters of Spring Creek and supports a mixture of upland, emergent wetland and scrub/shrub wetland. A proposed wetland mitigation project at this site will include approximately 8 acres of wetland creation and up to 20 acres of wetland enhancement. A summary of pre- and post-project wetland functional scores is provided in Table 1.

Table 1. Expected change in wetland functions and values, Bouchard site.

	Functional Points Pre-Project	Functional Points Post-Project	Factors Affecting Score
A. Listed/proposed T&E species habitat	.3	.3	No populations in area, not likely corridor
B. Habitat for S1, S2, or S3 plants or animals	.1	.1	No populations in area
C. General wildlife habitat	.8	1	Decreased disturbance
D. General fish/aquatic habitat	N/A	N/A	Not historic fish habitat
E. Flood attenuation	N/A	N/A	No channel
F. Short- and long-term surface water storage	.8	.8	Seasonal surface water
G. Sediment/nutrient/toxicant retention and removal	N/A	N/A	Does not receive excess sediment, nutrient, toxicant inputs
H. Sediment/shoreline stabilization	N/A	N/A	No channel
I. Production export/food chain support	.9	.9	Vegetation at site already diverse
J. Ground water discharge/recharge	1	1	Discharge/recharge indicators present
K. Uniqueness	.6	.8	Decreased disturbance
L. Recreation/education potential	.1	1	Decreased disturbance
Totals	4.6	5.9	

The following example assumes that 8 ($A_{created}$) new wetland acres are created and the functional score of 20 ($A_{existing}$) existing wetland acres shifts from 4.6 (F_{pre}) to 5.9 (F_{post}). Using Equation (2):

$$\text{Enhancement factor} = \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = \left(\frac{5.9 - 4.6}{4.6} \right) = 0.28$$

In this case, the enhancement factor equals 0.28. The corresponding enhancement ratio (1/0.28) would be 3.5 and would be expressed as 3.5 to 1, indicating 3.5 acres of enhancement replaces 1 impacted wetland acre.

Next, applying equation (3), it is possible to calculate the mitigation credits for the 20 acres of existing wetland that would be enhanced at the Bouchard site:

$$A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = 20(0.28) = 5.6 \text{ acres of credit for enhancement portion}$$

Finally, applying equation (4), it is possible to calculate total mitigation credits at the Bouchard site.

$$A_{credited} = A_{created} + A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = 8 + 20(0.28) = 13.65 \text{ total acres of credit}$$

Example 2

The Montana Department of Transportation has requested an assessment of wetland mitigation potential on the Ludwig property north of St. Ignatius, Montana. Because the decision to acquire this property partly depends upon how many wetland mitigation credits it is feasible to generate there, we decided to use the Ludwig property as an example of how one might use a functional score approach to calculate an appropriate crediting ratio for enhancement projects. Tables 1 and 2 include summaries of functional scores for (1) existing conditions and (2) estimated post-mitigation project conditions at each of the two proposed mitigation projects on the Ludwig property. A tributary to Post Creek runs through the property and was assessed as one wetland site (Table 2). The second wetland site consists of a created stock pond and small adjacent wetlands supported by the pond (Table 3). Both sites are impacted by livestock grazing and altered hydrology.

Stream Site. The Post Creek portion of the site would increase from an estimated 1.3 ($A_{existing}$) acres of wetland to 5.2 acres, resulting in 3.9 ($A_{created}$) created wetland acres. From Table 2, the functional score would shift from 5.4 (F_{pre}) to 9.5 (F_{post}). Using Equation (2):

$$\text{Enhancement factor} = \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = \left(\frac{9.5 - 5.4}{5.4} \right) = 0.76$$

Table 2. Expected change in wetland functions and values, Ludwig property, Post Creek Tributary.

MDT Assessment Method Functions and Values	Functional Points Pre-Project	Functional Points Post-Project	Factors Affecting Score
A. Listed/proposed T&E species	.3	.8	Grizzly, Sus/inc. to Doc/secondary
B. Habitat for S1, S2, or S3 plants or animals	.1	.7	Grizzly, Sus/inc. to Doc/secondary
C. General wildlife habitat	.5	.9	Increased cover
D. General fish/aquatic habitat	.1	.3	Increased cover and connectivity, but unlikely fish habitat
E. Flood attenuation	.2	.7	Increased size, woody component
F. Short- and long-term surface water storage	.4	.8	Increased size
G. Sediment/nutrient/toxicant removal	.9	.9	Close to highway, cattle removal
H. Sediment/shoreline stabilization	.7	1	Increase deep binding root mass
I. Production export/food chain support	.9	1	Increased size
J. Ground water discharge/recharge	1	1	
K. Uniqueness	.2	.4	Shift to shrub community
L. Recreation/education potential	.1	1	Not likely site
Total Functional Points	5.4	9.5	

Table 3. Expected change in wetland functions and values, Ludwig property, stock pond and adjacent wetlands.

MDT Assessment Functions and Values	Functional Points Pre-Project	Functional Points Post-Project	Factors Affecting Score
A. Listed/proposed T&E species	.3	.7	Grizzly bear use adjacent areas, increased cover may increase use
B. Habitat for S1, S2, or S3 plants or animals	.2	.2	No known occurrence
C. General wildlife habitat	.3	.9	Increased cover
D. General fish/aquatic habitat	N/A	N/A	No habitat
E. Flood attenuation	N/A	N/A	No overbank flow
F. Short- and long-term surface water storage	.7	.8	
G. Sediment/nutrient/toxicant removal	1	1	Close to highway, cattle removal
H. Sediment/shoreline stabilization	N/A	N/A	
I. Production export/food chain support	.6	.7	Increased structural diversity
J. Ground water discharge/recharge	1	1	
K. Uniqueness	.1	.4	Shift to shrub
L. Recreation/education potential	.1	1	Not likely site
Total Functional Points	4.3	6.7	

In this case, the enhancement factor equals 0.76. The corresponding enhancement ratio (1/0.76) would be 1.32 and would be expressed as 1.32 to 1, indicating 1.32 acres of enhancement replaces 1 impacted wetland acre.

Next, applying equation (3), it is possible to calculate the mitigation credits for the 1.3 acres of existing wetland that would be enhanced at the Ludwig stream channel site:

$$A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = 1.3(0.76) = 0.98 \text{ acres of credit for enhancement portion}$$

Finally, applying equation (4), it is possible to calculate total mitigation credits at the Ludwig stream channel site.

$$A_{credited} = A_{created} + A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = 3.9 + 1.3(0.76) = 4.9 \text{ total acres of credit}$$

Stock Pond Site. The stock pond portion of the site would increase from an estimated 0.35 ($A_{existing}$) acres of wetland to 1.8 acres, resulting in 1.45 ($A_{created}$) created wetland acres. From Table 3, the functional score would shift from 4.3 (F_{pre}) to 6.7 (F_{post}). Using Equation (2):

$$\text{Enhancement factor} = \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = \left(\frac{6.7 - 4.3}{4.3} \right) = 0.56$$

In this case, the enhancement factor equals 0.56. The corresponding enhancement ratio (1/0.56) would be 1.79 and would be expressed as 1.79 to 1, indicating 1.79 acres of enhancement replaces 1 impacted wetland acre.

Next, applying equation (3), it is possible to calculate the mitigation credits for the 0.35 acres of existing wetland that would be enhanced at the Ludwig stock pond site:

$$A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = 0.35(0.56) = 0.20 \text{ acres of credit for enhancement portion}$$

Finally, applying equation (4), it is possible to calculate total mitigation credits at the Ludwig stock pond site.

$$A_{credited} = A_{created} + A_{existing} \left(\frac{F_{post} - F_{pre}}{F_{pre}} \right) = 1.45 + 0.35(0.56) = 1.64 \text{ total acres of credit}$$

CSKT Mitigation Ratios from Wetlands Conservation Plan (pre-project only)

*Prepared by Tom Parker, Ecologist, Herrera Environmental Consultants, Inc.
May 2, 2002*

Impacted Wetland Type	Mitigation Type			
	<i>Preservation</i>	<i>Restoration</i>	<i>Enhancement</i>	<i>Creation</i>
Forested and Shrub	3:1	2.5:1	4:1	4:1
Emergent and Open Water	2:1	1.5:1	3:1	3:1

Equation for calculating required mitigation acres based on CSKT Mitigation Guidelines.

$$\text{Required mitigation acres} = P(3 I_{sf} + 2 I_{oe}) + R(2.5 I_{sf} + 1.5 I_{oe}) + E(4 I_{sf} + 3 I_{oe}) + C(4 I_{sf} + 3 I_{oe})$$

Where:

I_{sf} = # of scrub/shrub or forested impact acres = 18

I_{oe} = # of emergent or open water impact acres = 32

P = estimated **Preservation** proportion of mitigation area

R = estimated **Restoration** proportion of mitigation area

E = estimated **Enhancement** proportion of mitigation area

C = estimated **Creation** proportion of mitigation area

Example 1: To find required mitigation acres, assuming that mitigation projects will be distributed as follows based on area: Preservation = 30 percent; Restoration = 50 percent; Enhancement = 10 percent; Creation = 10 percent.

$$.3 (3*18 + 2*32) + .5(2.5*18+1.5*32) + .1(3*18 + 4*32) + .1(3*18 + 4*32) = 104.2 \text{ required acres}$$

Example 2: To find required mitigation acres, assuming that mitigation projects will be distributed as follows based on area: Preservation = 10 percent; Restoration = 90 percent; Enhancement = 0 percent; Creation = 0 percent.

$$.1 (3*18 + 2*32) + .9(2.5*18+1.5*32) + 0(3*18 + 4*32) + 0(3*18 + 4*32) = 96.0 \text{ required acres}$$

Example 3: Given 18 impacted acres (36% of total) of shrub or forested and 32 impacted acres (64 percent of total) of open water or emergent, what is the weighted ratio for restoration projects?

$$2.5(.36) + 1.5(.64) = 1.86$$

Therefore: A 20-acre restoration project will mitigate for $20/1.86 = 10.75$ impacted acres.
